

Giant radio galaxies with LOFAR

Emanuela Orru'

Outline

- ◆ Giant Radio Galaxies
- ◆ GRG working group
- ◆ LOFAR results
- ◆ GRG in Tier 1 fields

Giant radio galaxies

- * *projected linear size > 1 Mpc*
- * *old radio galaxies evolved in a low density medium: low energy electrons*
- * *information over large portions of IGM - B in low density environment*
- * *energy transport at Mpc scales*
- * *200 known GRG potentially biased*
- * *highly polarized at high frequencies*
- * *good calibrators in polarization - RM grid*

GRG

Working Group

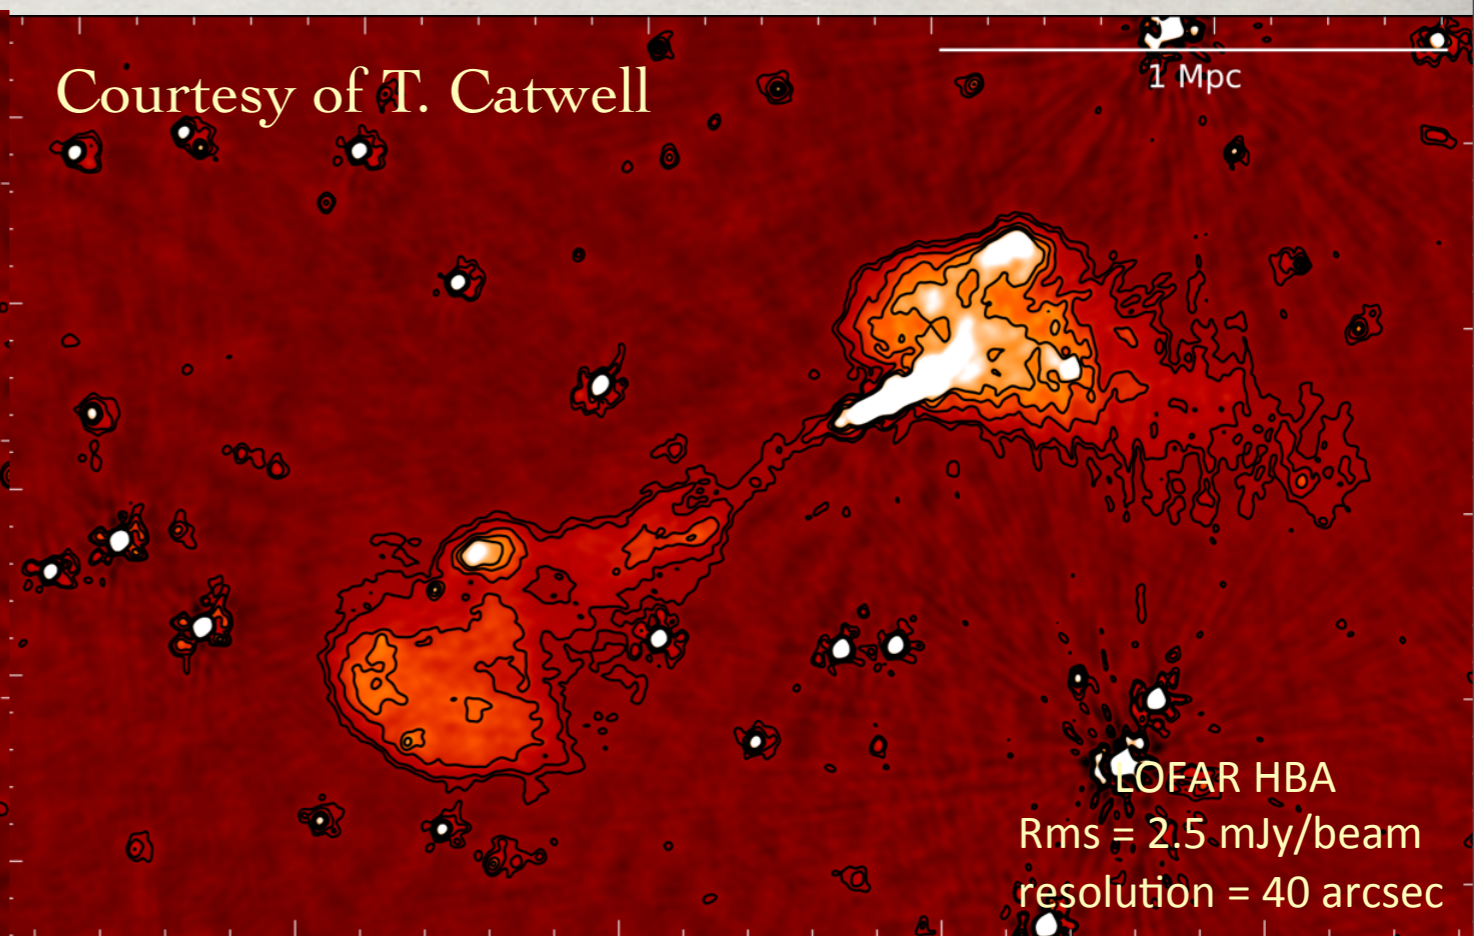

Chair . **E. Orru'** - P. Alexander - **M. Jamrozy** - **V. Heesen** - E. Middelberg - R. Pizzo - J. Riley - G. de Bruyn - M. Birkinshaw - L. Saripalli - **T. Cantwell** - **D. Mulcahy** - A. Bonafede - A. Scaife - R. Morganti - J. Croston - **A. Shulevsky** - **T. Shimwell**, **C. Roskowsinski**, P. Bartel. New: **Pratik Dabhade**

- * Joined effort of MKSP & Nearby AGN (Chair R. Morganti)
- * Study of interesting targets multi-frequency data available
- * Long term plan: synergy with SKSP search GRGs in survey fields.
- * One telecon once per month
- * Common goal obtain good total intensity image and run RM synthesis on each field.
- * Overlap with Nearby galaxies and Galactic foregrounds WGs

NGC 6251

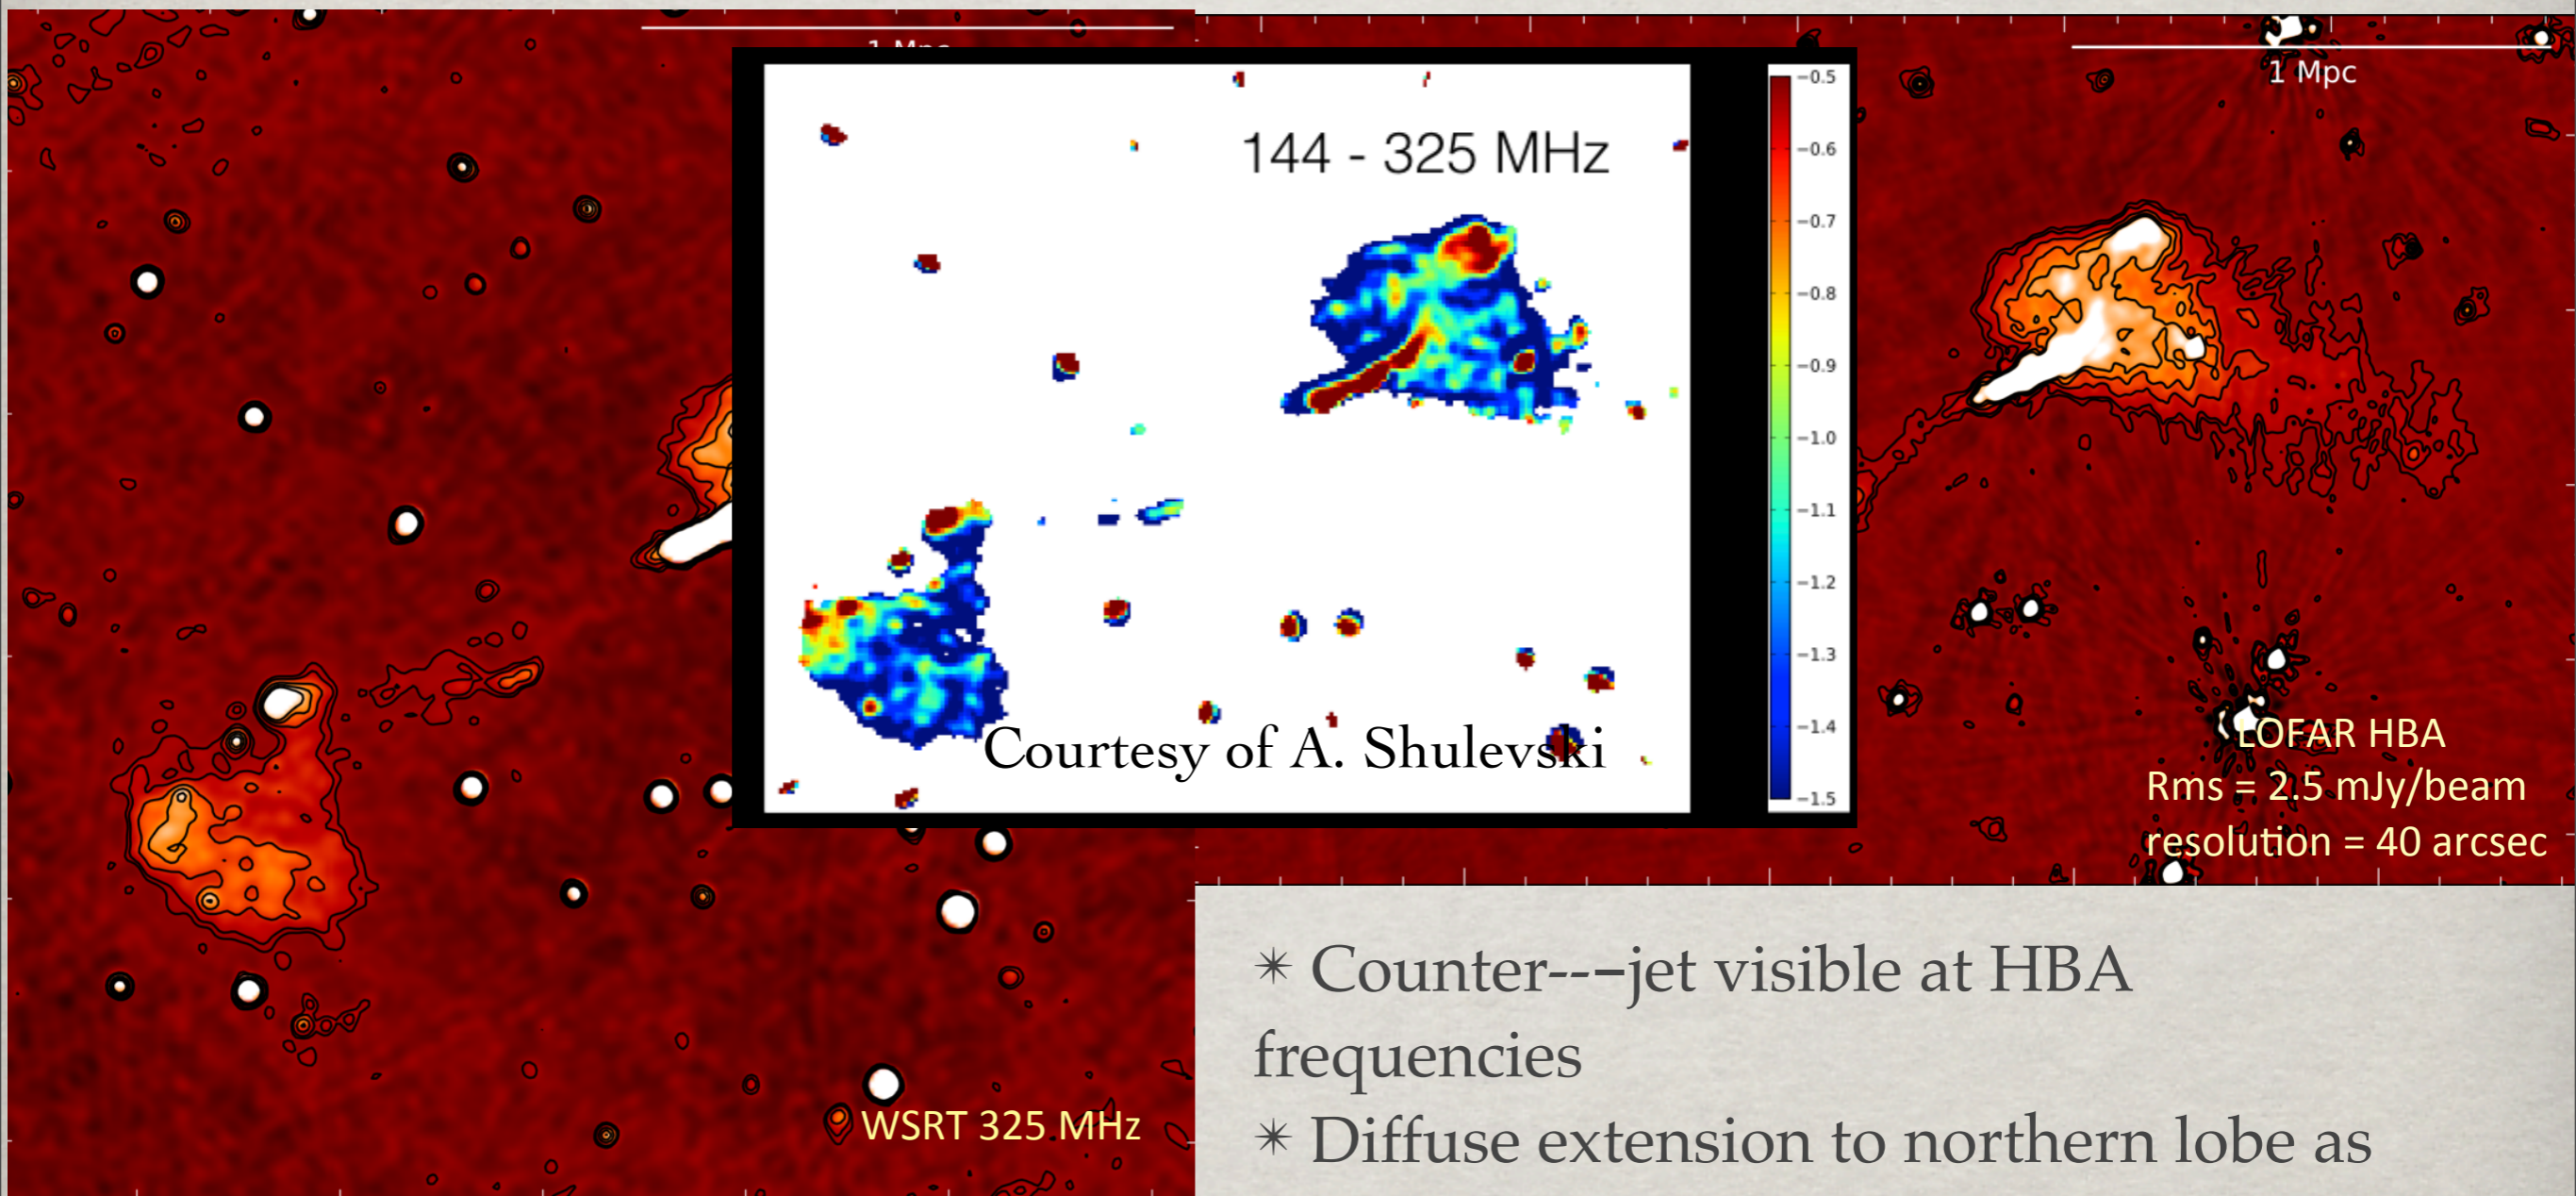

Courtesy of T. Catwell

$z=0.024710$

- * Counter--jet visible at HBA frequencies
- * Diffuse extension to northern lobe as visible at these frequencies
- * Direction dependent calibration necessary to reduce the noise and artifacts in the image

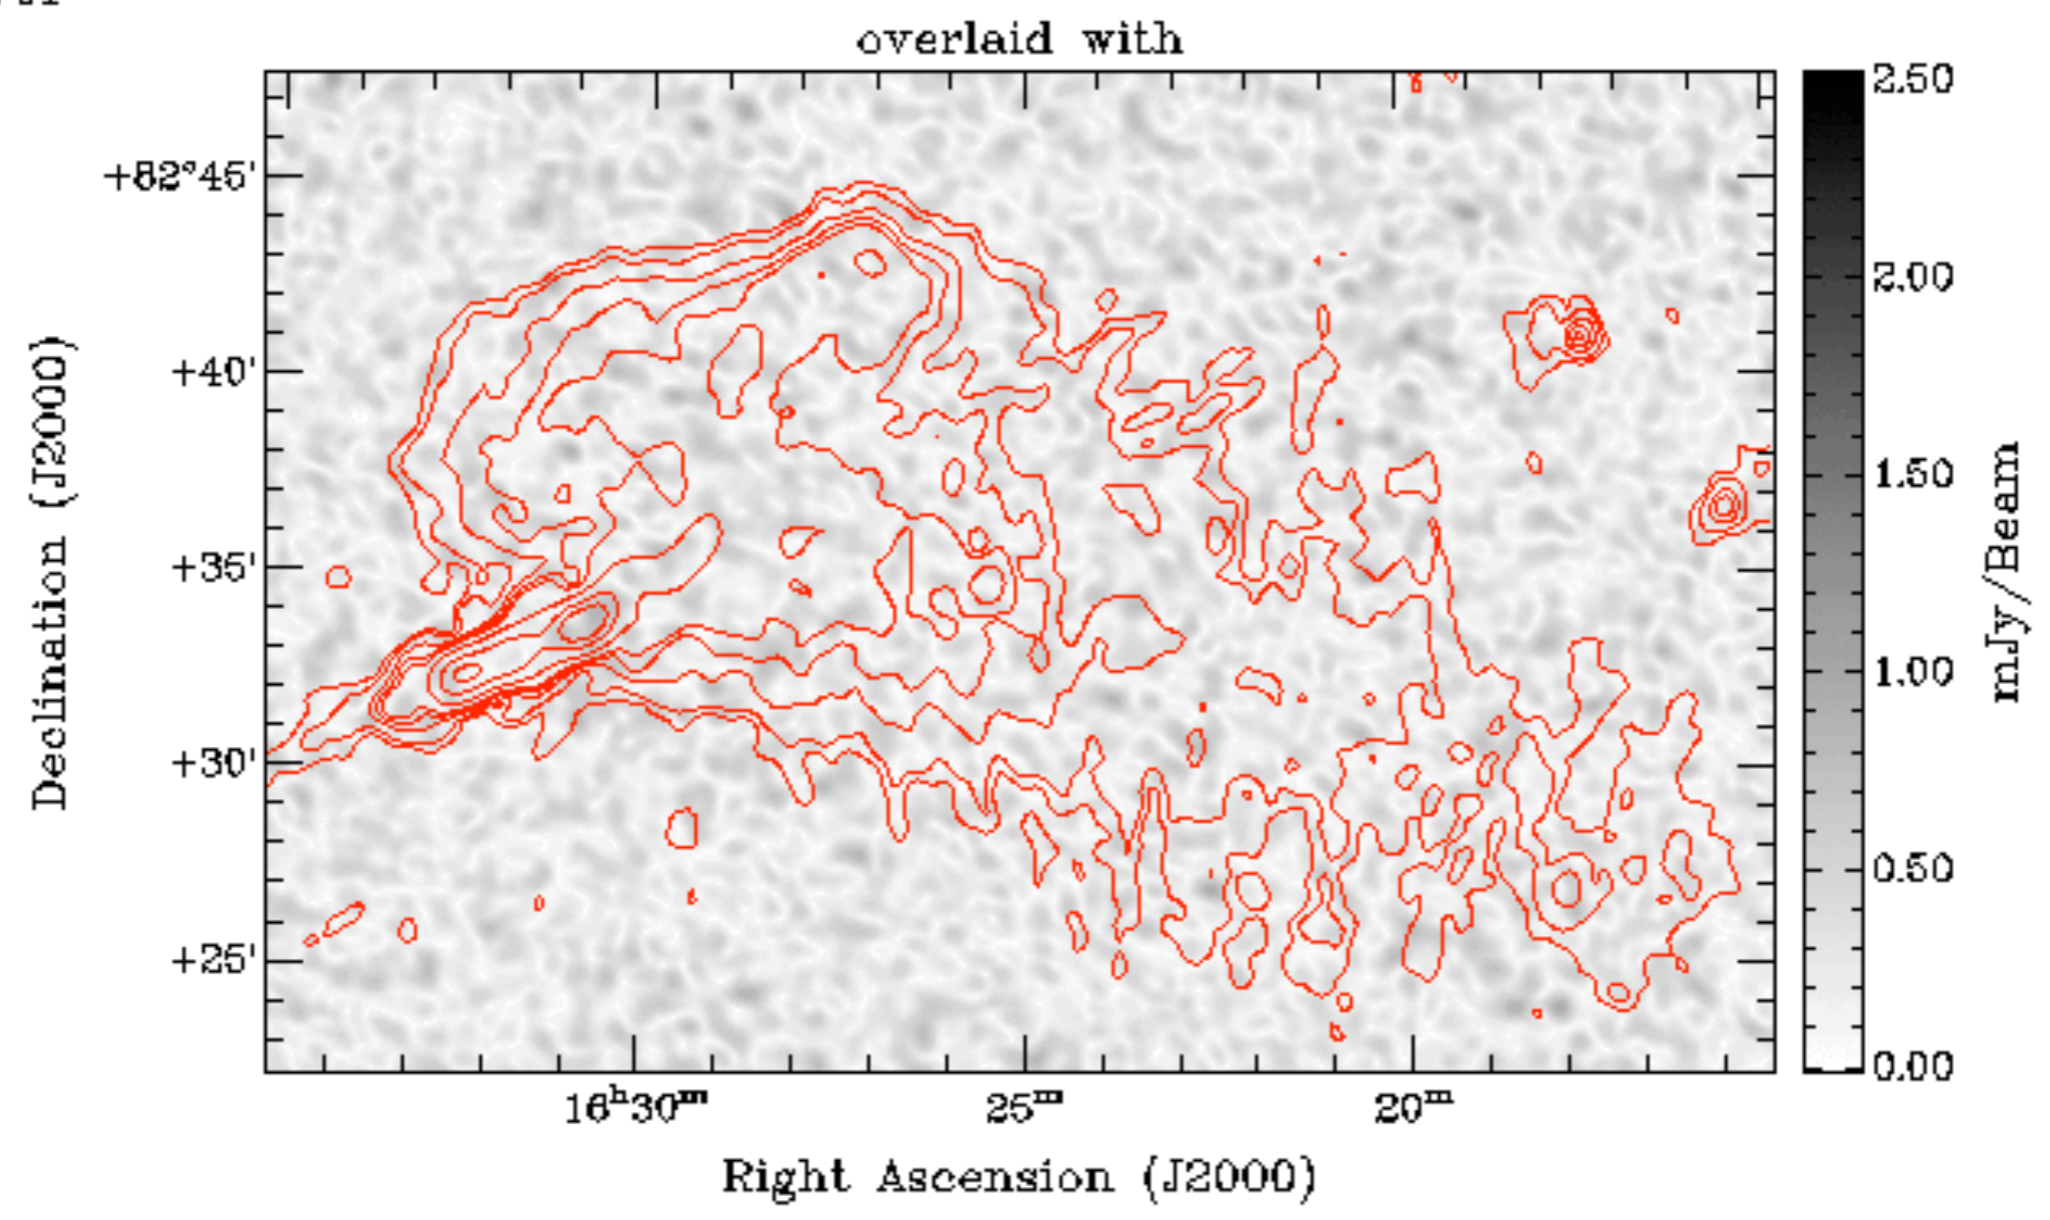

NGC 6251

$z=0.024710$

- * Counter--jet visible at HBA frequencies
- * Diffuse extension to northern lobe as visible at these frequencies
- * Direction dependent calibration necessary to reduce the noise and artifacts in the image

3C 31

* $z=0.0169$

* 3C31 is a Giant
with Lofar L=1.1
Mpc

* Bridge emission
between the lobes

*Spectral index power-law up to 100 kpc
(jets / lobes), exponential drop of emission $>$
200 kpc from nucleus (tails).

*Spectral steepening modeled with advective
cosmic-ray model.

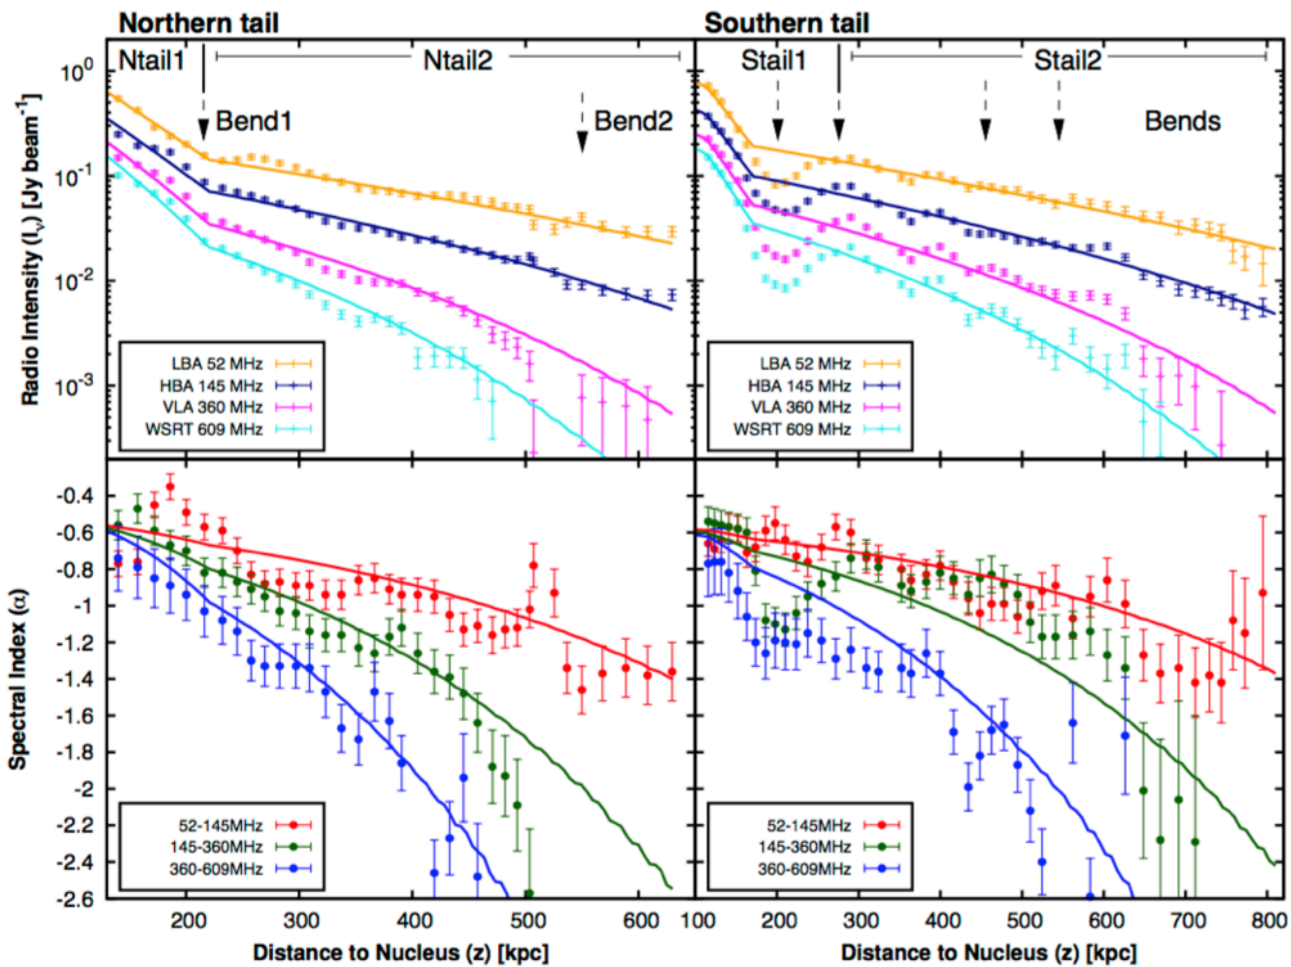

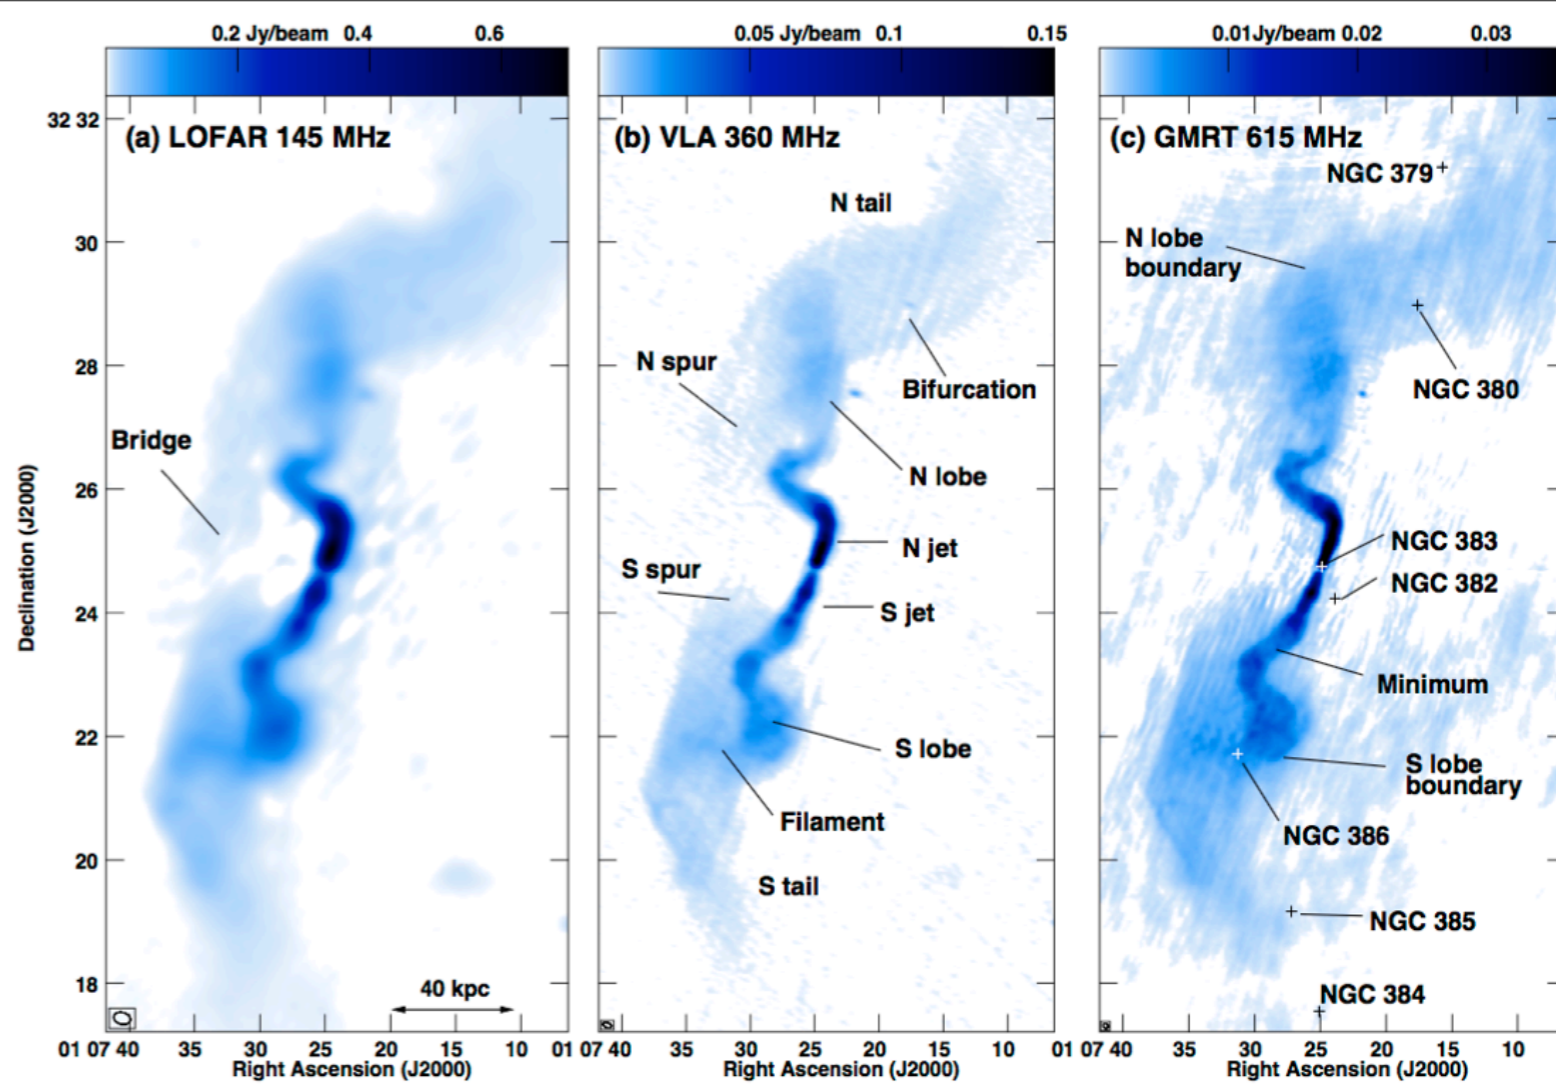

*Magnetic field strength in radio tails 1–
10 μ G, with $\sim 3\mu$ G on average. Agreement
with JP model.

Subclass of GRG are Double-double RG

DEF: DDRG consists of a pair of double radio sources with a common centre

(Schoenmakers et al. 2000)

Are the evidence of recurrent jet activity in AGN

- * well aligned within 10 deg or X-shaped, inner edge-brightened
- * outer no hotspot but one case
- * moderate redshift (selection effect?)
- * linear size \sim Mpc, no frequent in small RG samples
- * inner doubles in DDRGs has an FR II structure although its luminosity belongs to the FRI category or lie in the borderline of the FRI/FR II classification
- * HI absorption observed in few DDRG
- * small RM

Pre-factor low-resolution

LOFAR HBA

- * no detection of the core (GPS)
- * 4 components resolved
- * new features elongation of inner lobes
- * South-inner misalignment of elongation w.r.t the outer lobe
- * The fit of the CI was not satisfactory for the inner lobes. We fit a CI + a PL to take into account for the new feature
- * The outer since they are expected to be powered off we fitted the Cloff

Polarization

- * To study the IGM properties.
- * Detection lower than expected due to various reasons:
ionosphere, calibration ...
- * confirmed the RM found at high frequencies.
- * Plan to create RM-grid for each field.

Cross match catalogues of known GRG with Tier 1 pointings.

Catalogue courtesy of M. Jamrozy
Images courtesy of T. Shimwell.

(1) 200 GRG unpublished catalogue cross matched with 60 survey fields

- found 2 GRG
- not same quality due to artifacts - direction independent calibration.

(2) match the catalogue of known GRG to the 200 pointings

- found 28 GRG
- imaged 1 SB
- detection most of the cases, some fields very poor quality - FACTOR will improve them.

(3) If we find interesting sources these will have the priority to be processed with FACTOR.

- availability of radio data at higher frequencies
- environmental study based on X-ray data.

New-GRGs from Tier 1

Pratik Dabhade (IUCAA, India)

- * few sample of GRGs found via visual inspection of Tier 1 fields.
- * resolution 20", rms ~ 0.3-0.8 mJy/beam

Challenges

- ◆ computing facilities
- ◆ man power (technical/software people)
- ◆ initial catalogue
- ◆ artifact free images
- ◆ detection of faint and extended features from catalogue by source founding (new method recently published)
- ◆ tools for standard assessment of results
- ◆ search and identification of the object on other surveys, redshifts, follow ups etc.

Conclusions and future plans

- *The study of GRG at low frequency reveals interesting properties of the AGN low energy particle population and magnetic fields.
- *The study of DDRG provides information about multiple jet activity keeping track of AGNs duty cycle up to very “old particles”
- *The GRG working group:
 - * is concentrating its activity on single targeted observations
 - *in the long term cross match with GRG catalogues
 - *exploitation of Survey fields to compile new catalogues of GRG and DDRG - more difficult blind search / detection of new GRG and DDRG
