2025/10/25 00:46 1/1 DROP cluster

## **DROP** cluster

- Drop is:
  - With 7 nodes at 8 cores each, DROP is designed for non-interactive queue-based parallel supercomputing.
- \* Drop is not:
  - For anything that is interactive, uses less

than 8 parallel cores per job, is not queue-able, or generally takes less than a few nights to run on your desktop, you had better use one of the stand-alone servers.

- Drop has only scratch storage. Move important data to a different server. Anything on /data/ can be deleted without notice.
- Kindly note that this cluster comes 'as is' with no support from IT, Joeri or Jason.
- \* Come see Joeri for an account \* File systems
  - /export/home/<user>
    - RAID6, 20GB/user quota
  - /data (crossmounted over all nodes) = RAID0, unlimited space
    - RAID0, 5TB, no quotas
    - heaviest users will have older data auto-deleted by semi-random script, so better clear it out yourself
