

## Recent progress toward pipelined imaging with LOFAR

George Heald (on behalf of the LOFAR commissioning  
team, and especially the Busy Week participants)  
26 August 2010

- The LOFAR array ca. August 2010
- LOFAR Imaging Pipeline
- Calibration examples
- First imaging results and recent progress toward normal operations
- Along the way, we are developing the LOFAR Imaging Cookbook:  
[http://www.mpa-garching.mpg.de/~fdg/LOFAR\\_cookbook/](http://www.mpa-garching.mpg.de/~fdg/LOFAR_cookbook/)  
(courtesy of Roberto Pizzo & Francesco de Gasperin)

## The LOFAR Imaging Cookbook: Manual data reduction with the imaging pipeline

Written by Timothy Garn (and updated by Roberto Francesco Pizzo, with contributions from Vishambhar Nath Pandey, Evert RoI, Anna Scaife, and John Swinbank, on behalf of the LOFAR commissioning teams)\*

Version 3.0 - 22 July 2010

This cookbook describes the process of manually reducing a Measurement Set with the LOFAR imaging pipeline. It is intended to speed up the learning process for future commissioning, by collating various tips, tricks, and solutions in a single place. The LOFAR wiki<sup>1</sup> contains much more information on each stage of data reduction, but might be out of date in many places. The LOFAR forum<sup>2</sup> should also be helpful for commissioning. The contents of this cookbook are an approximation to the correct way of reducing LOFAR data – use with caution.

The softwares that have been designed for LOFAR data reduction are still in development. Sometimes, quicker results might be obtained with other data reduction packages (such as CASA). However, to test and improve the quality of the new software, we strongly encourage the users to follow the proposed way of the cookbook, post results or problems in the LOFAR forum, and talk to the software developers.

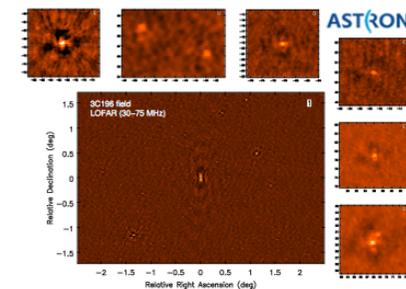

Figure 1: You too can make images like this with LOFAR

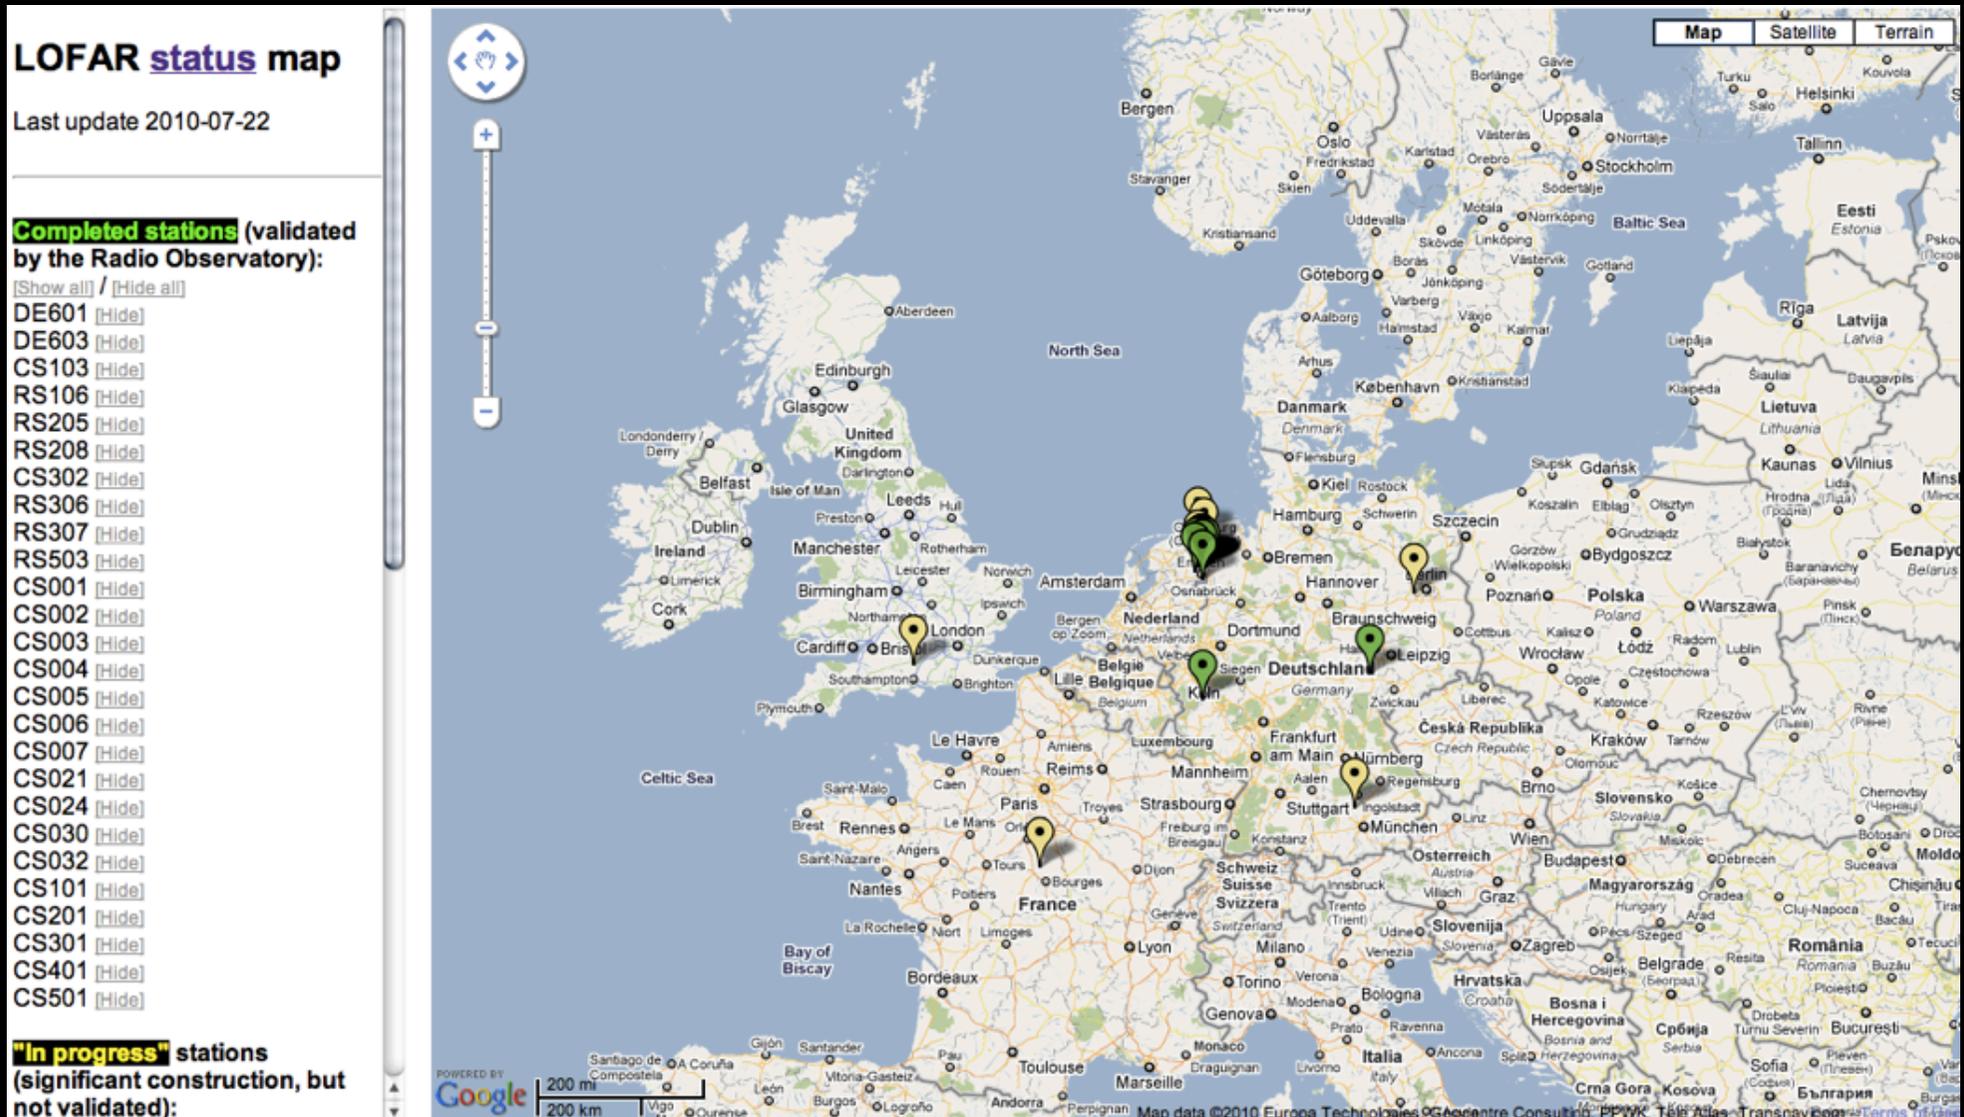

\*for any suggestions and comments, please contact Roberto Francesco Pizzo, [pizzo@astron.nl](mailto:pizzo@astron.nl)

# Imaging pipeline schematic

# Imaging pipeline schematic

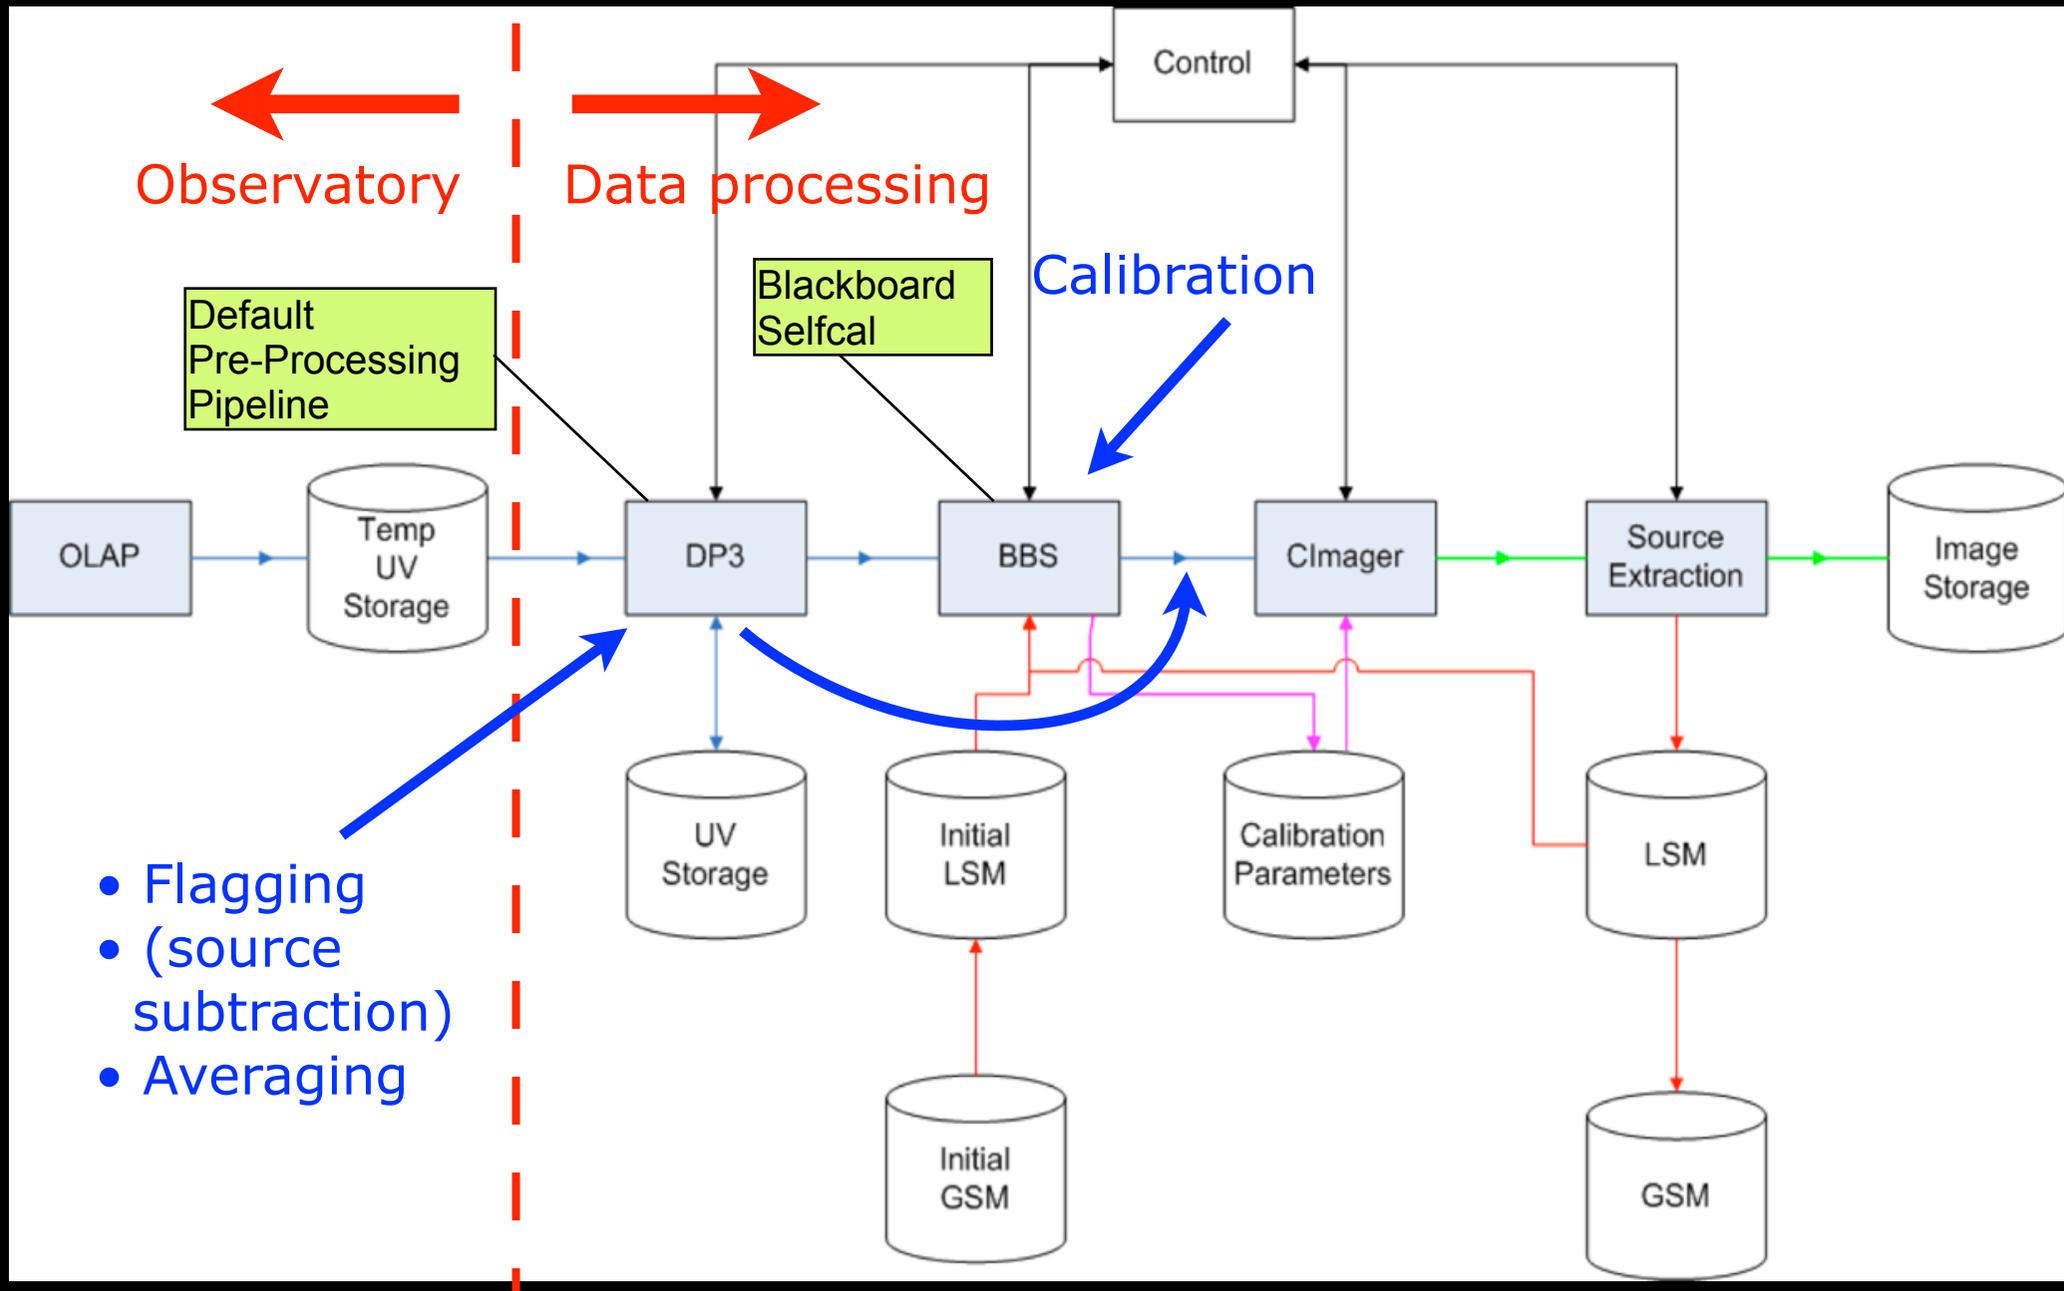

# Imaging pipeline schematic

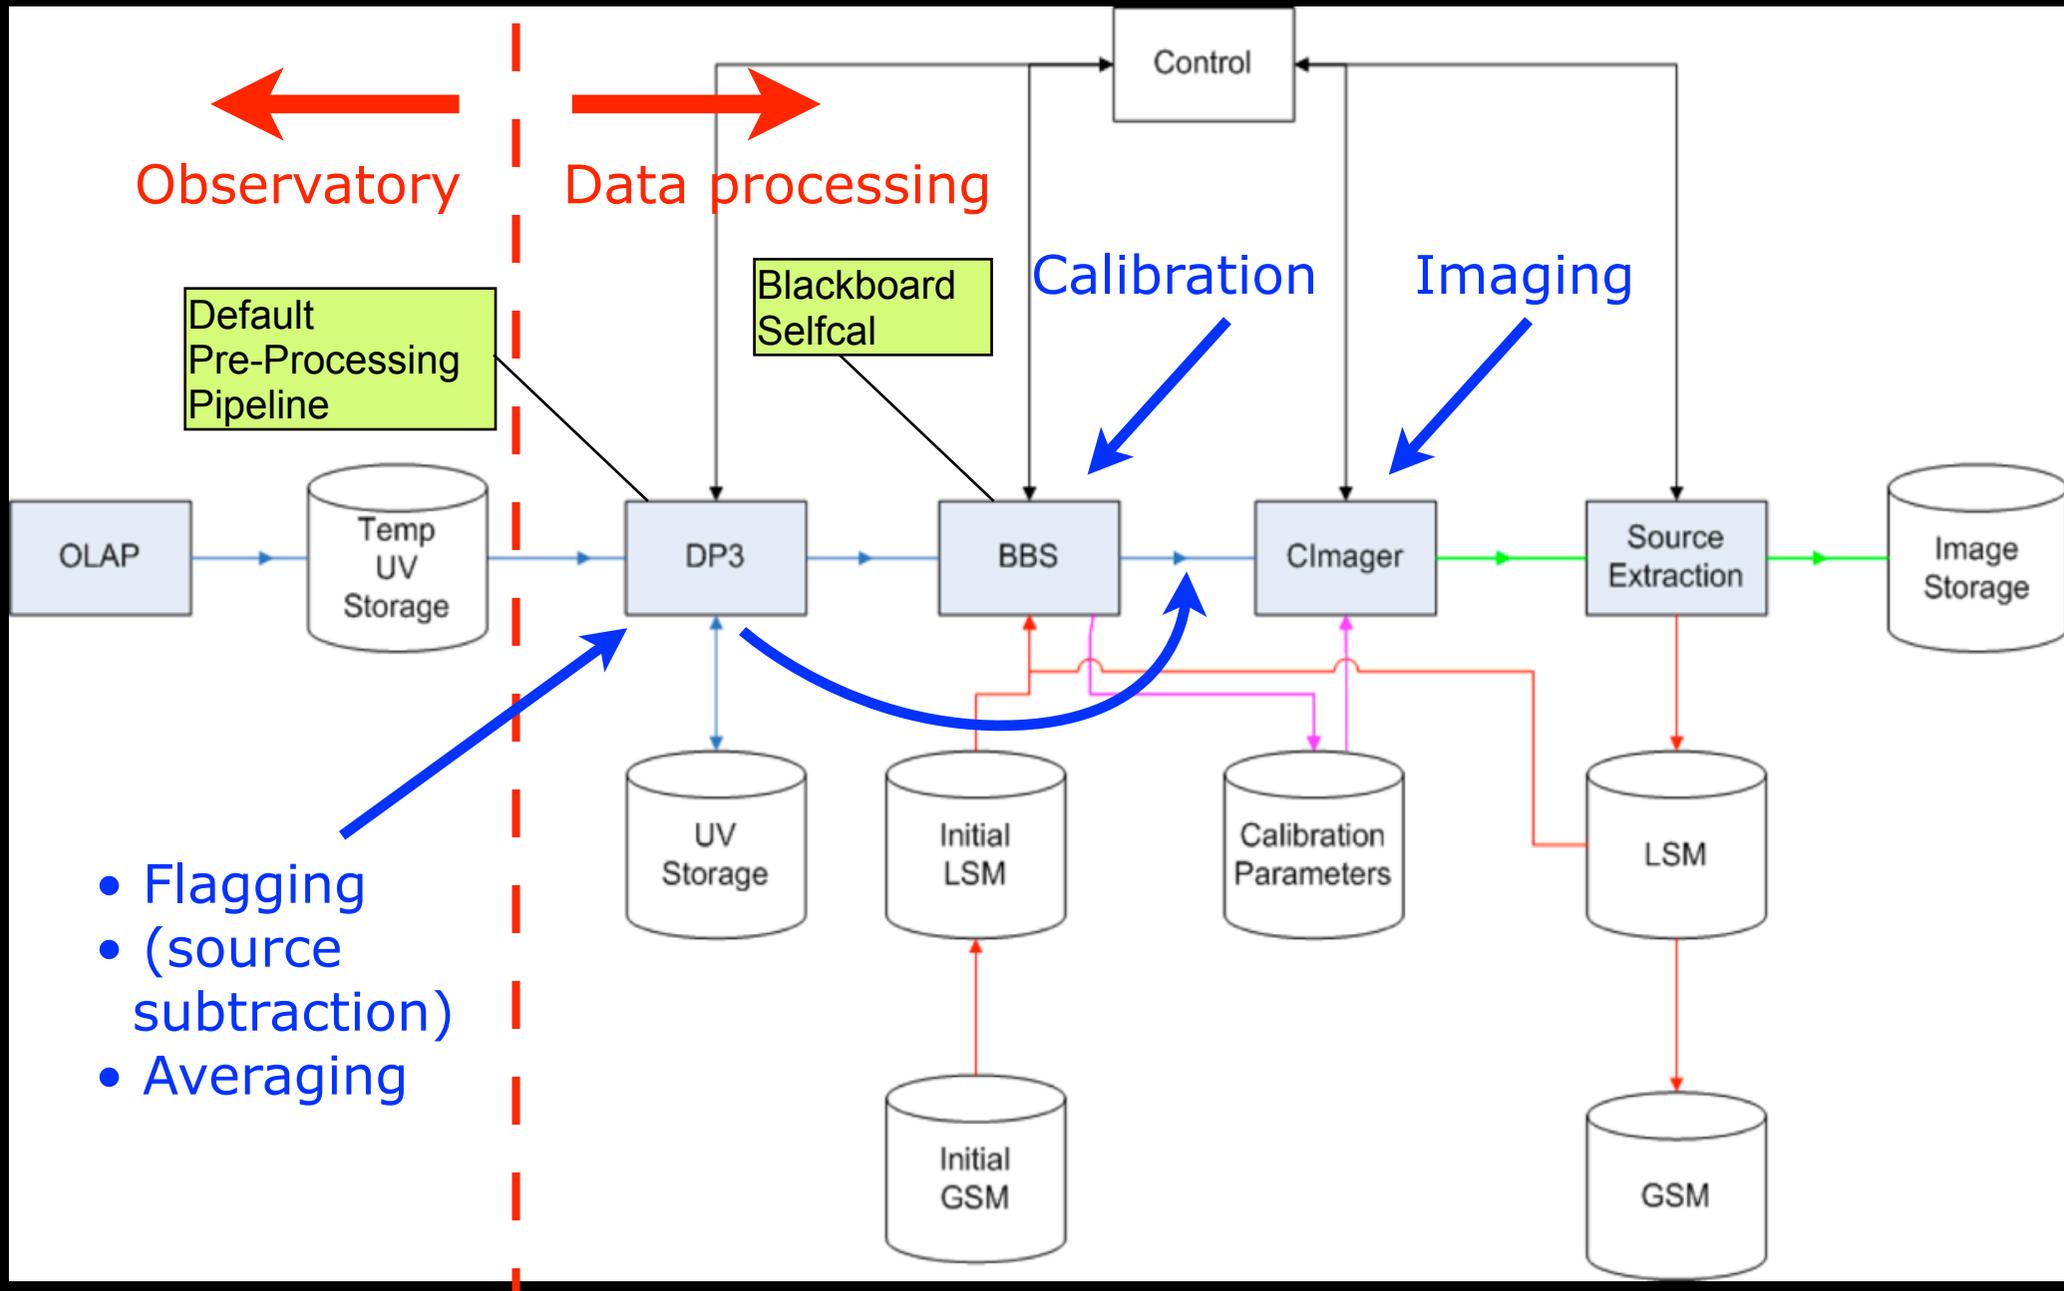

# Imaging pipeline schematic

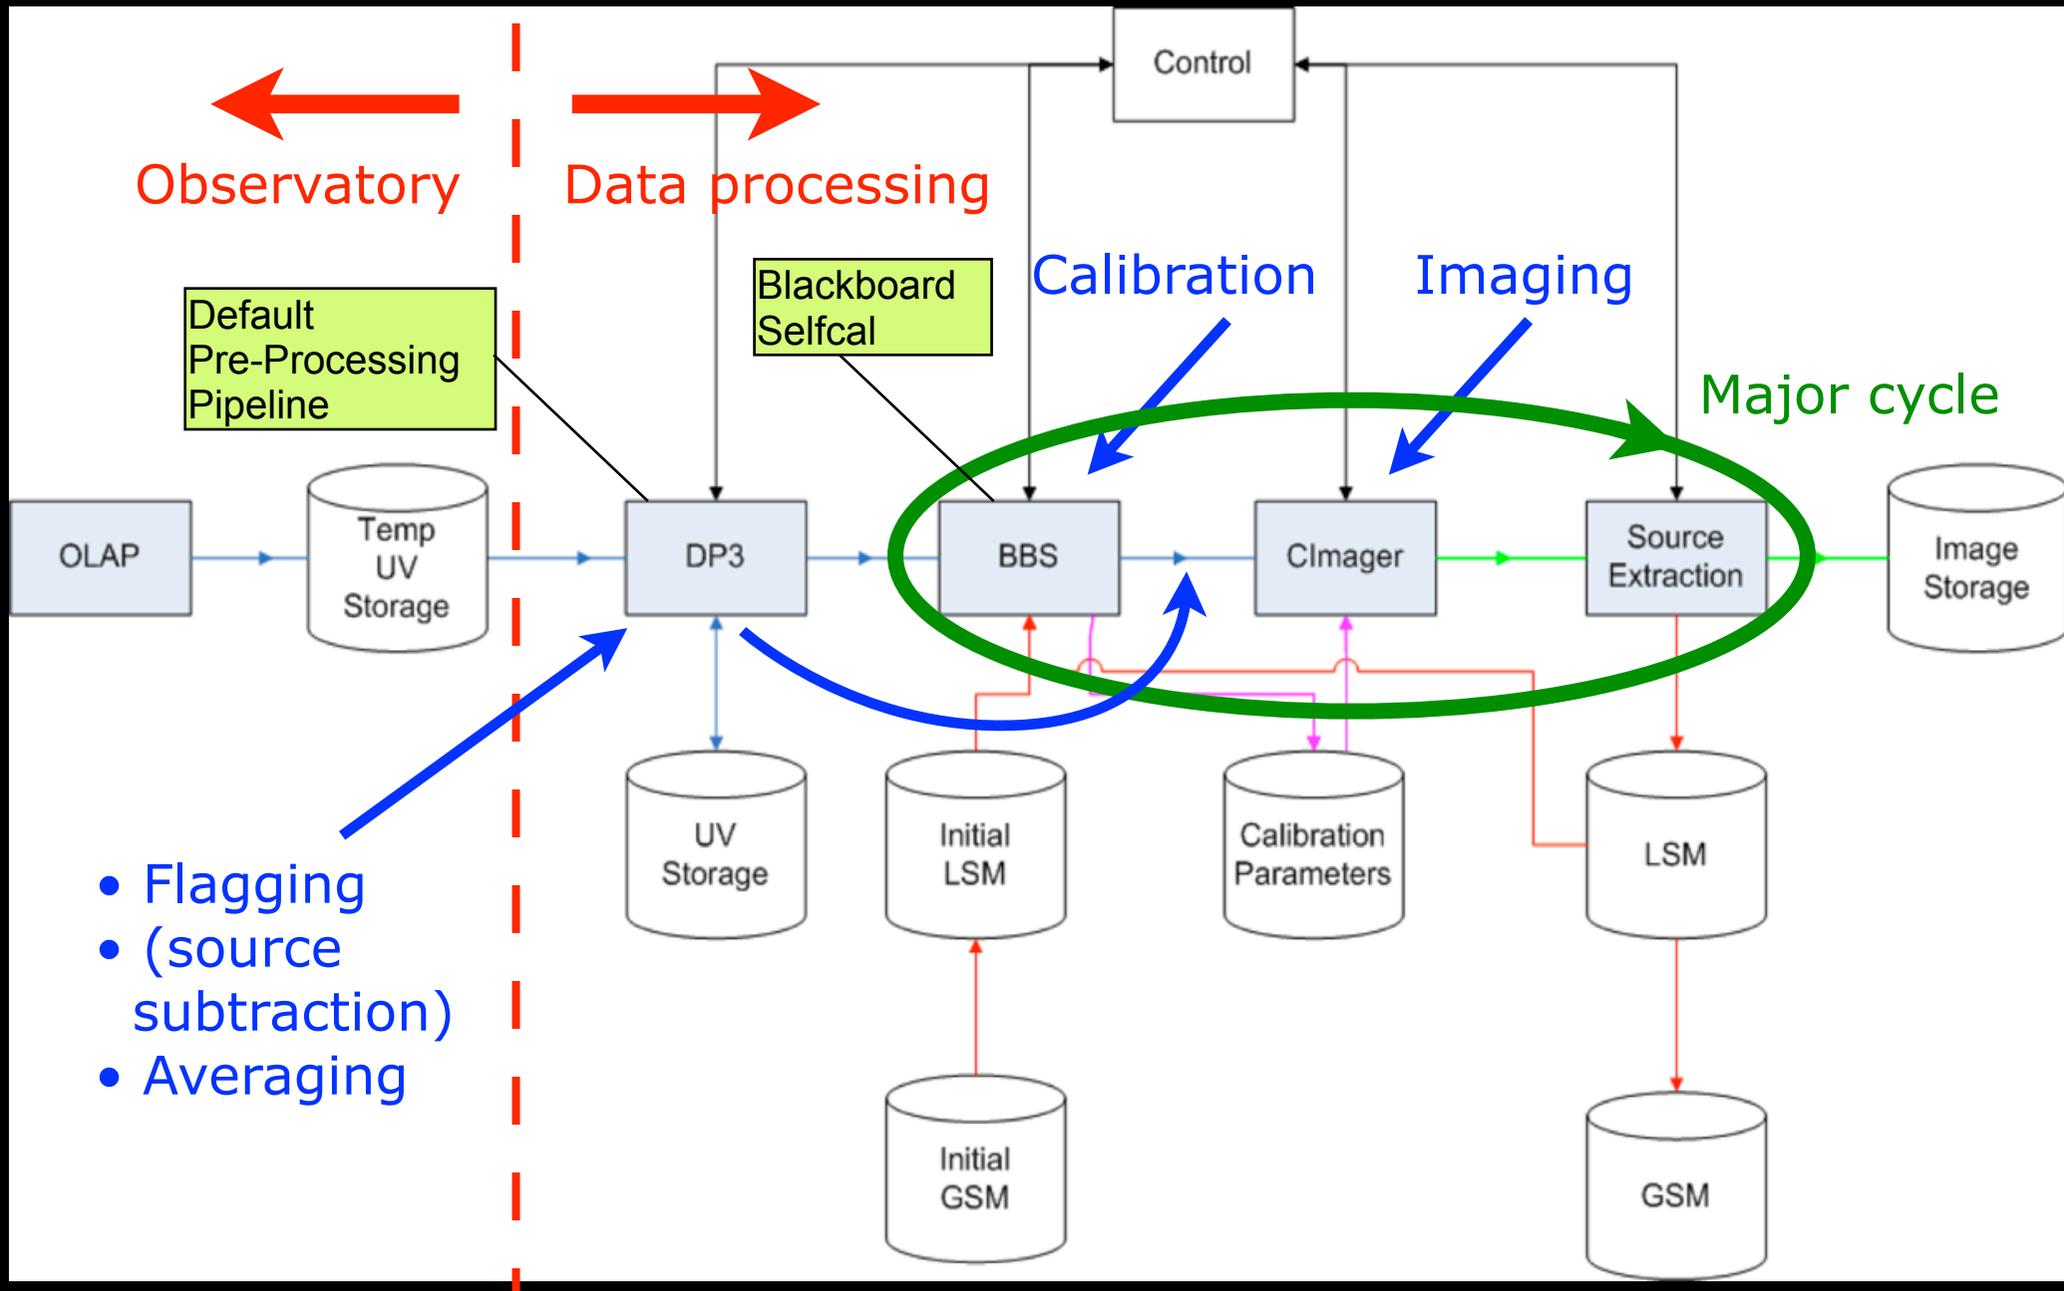

# Imaging pipeline schematic

# Imaging pipeline schematic

- Pipeline is implemented in python, and wraps together a hodge-podge of components (compiled executables, python scripts, libraries)
- Designed to be under control of the LOFAR MAC system - e.g. a pipeline run will be initiated at the end of a normal imaging observation to generate standard system output (images, cubes, ...)
- Based on the LOFAR Transients Pipeline developed by John Swinbank (John is also instrumental in pushing forward the Imaging Pipeline development)
  - Each component of the pipeline is wrapped in a “recipe” which homogenizes the interface to the components, and provides services such as distribution over the processing cluster
  - The recipe + input parameters = tasks which move data through the pipeline

- High frequency (1 channel  $\sim 700$  Hz) and time ( $\sim 1$ -3 sec typical) sampling allows excellent RFI excision

- High frequency (1 channel  $\sim 700$  Hz) and time ( $\sim 1-3$  sec typical) sampling allows excellent RFI excision

- LOFAR data sets are HUGE ... for a typical recent observation:

4 hr, 1 second integration

18 (core) LBA stations

1 subband = 256 channels, 4 correlations

1 subband = 20 GByte

248 subbands ~ 5 TByte

- Fast access to visibilities for baseline-based plotting required!  
Best option was a home-grown python script using pyrap, ppgplot, and (optionally) Tkinter
- *Not pretty or feature-rich, but it does the job quickly*
- Will also prove useful for automated pipeline diagnostic output

# Aside: plotting visibilities

  - Station gains solvable, even for complicated sources and relatively poor uv coverage in the present array
  - Ionosphere is, so far, well behaved!
  - Extra complications present in LOFAR data ...
- The Imaging Pipeline works as an automated system right now on “known fields”: we have been focusing on improving the individual components, and are now extending to 10min “blind field” snapshots

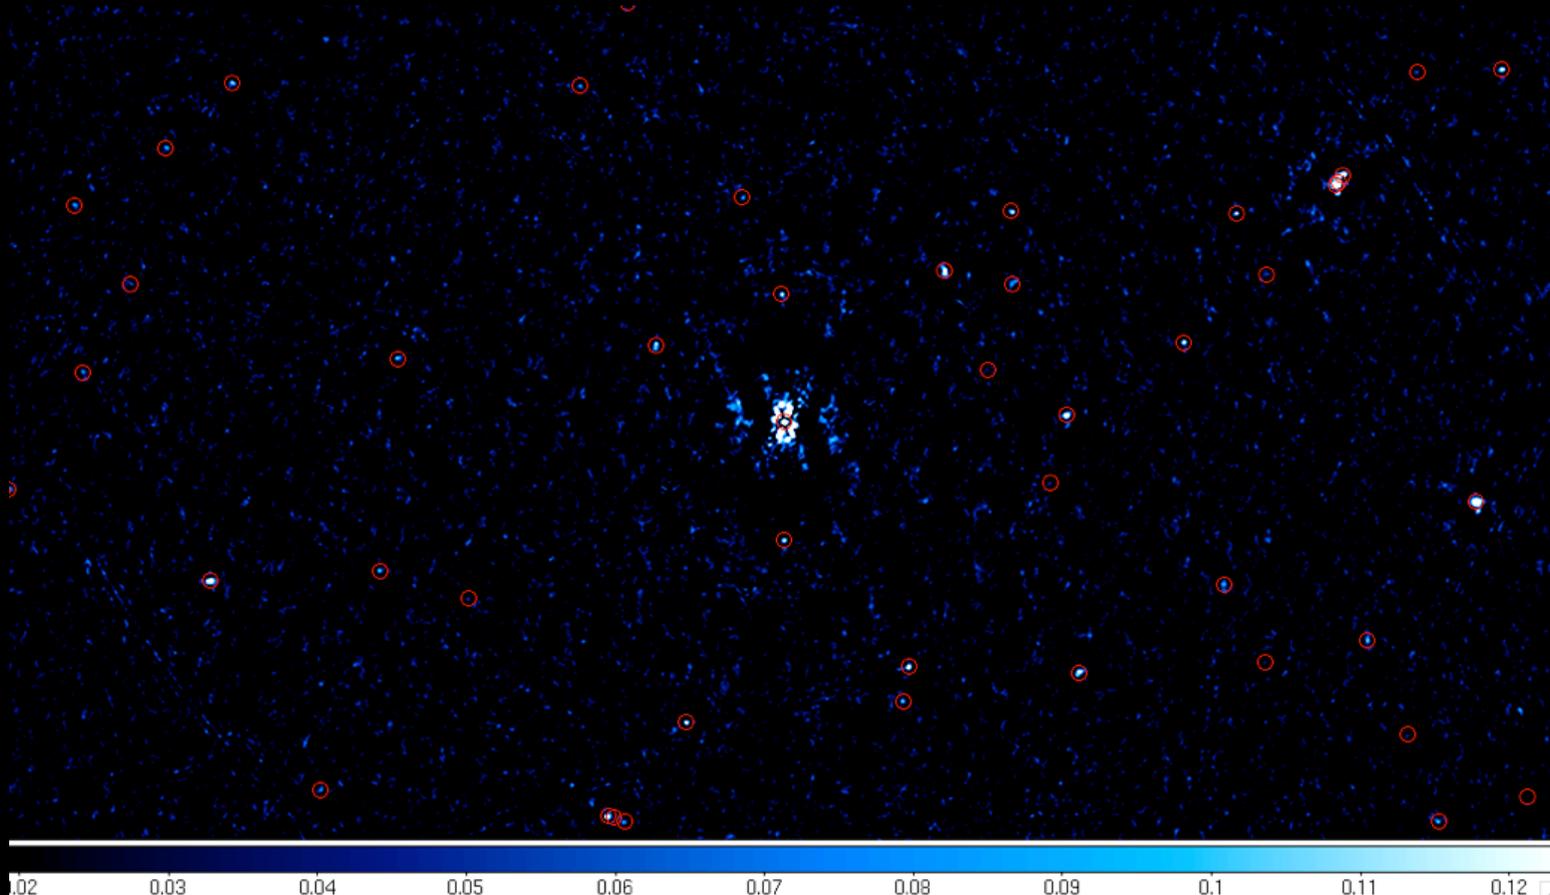

- Initial (Mark-0) GSM is VLSS catalog:  
Sky model generation now automated
- Mark-1 GSM will be created by the upcoming "MSSS"
- Pipeline kickoff by observatory system
- Major cycle loop: skymodel updates via source characterization (instead of clean components)
- Major benefit will come from station beam calibration
- *Application of direction dependent effects required in the imager*

# Recent imaging results

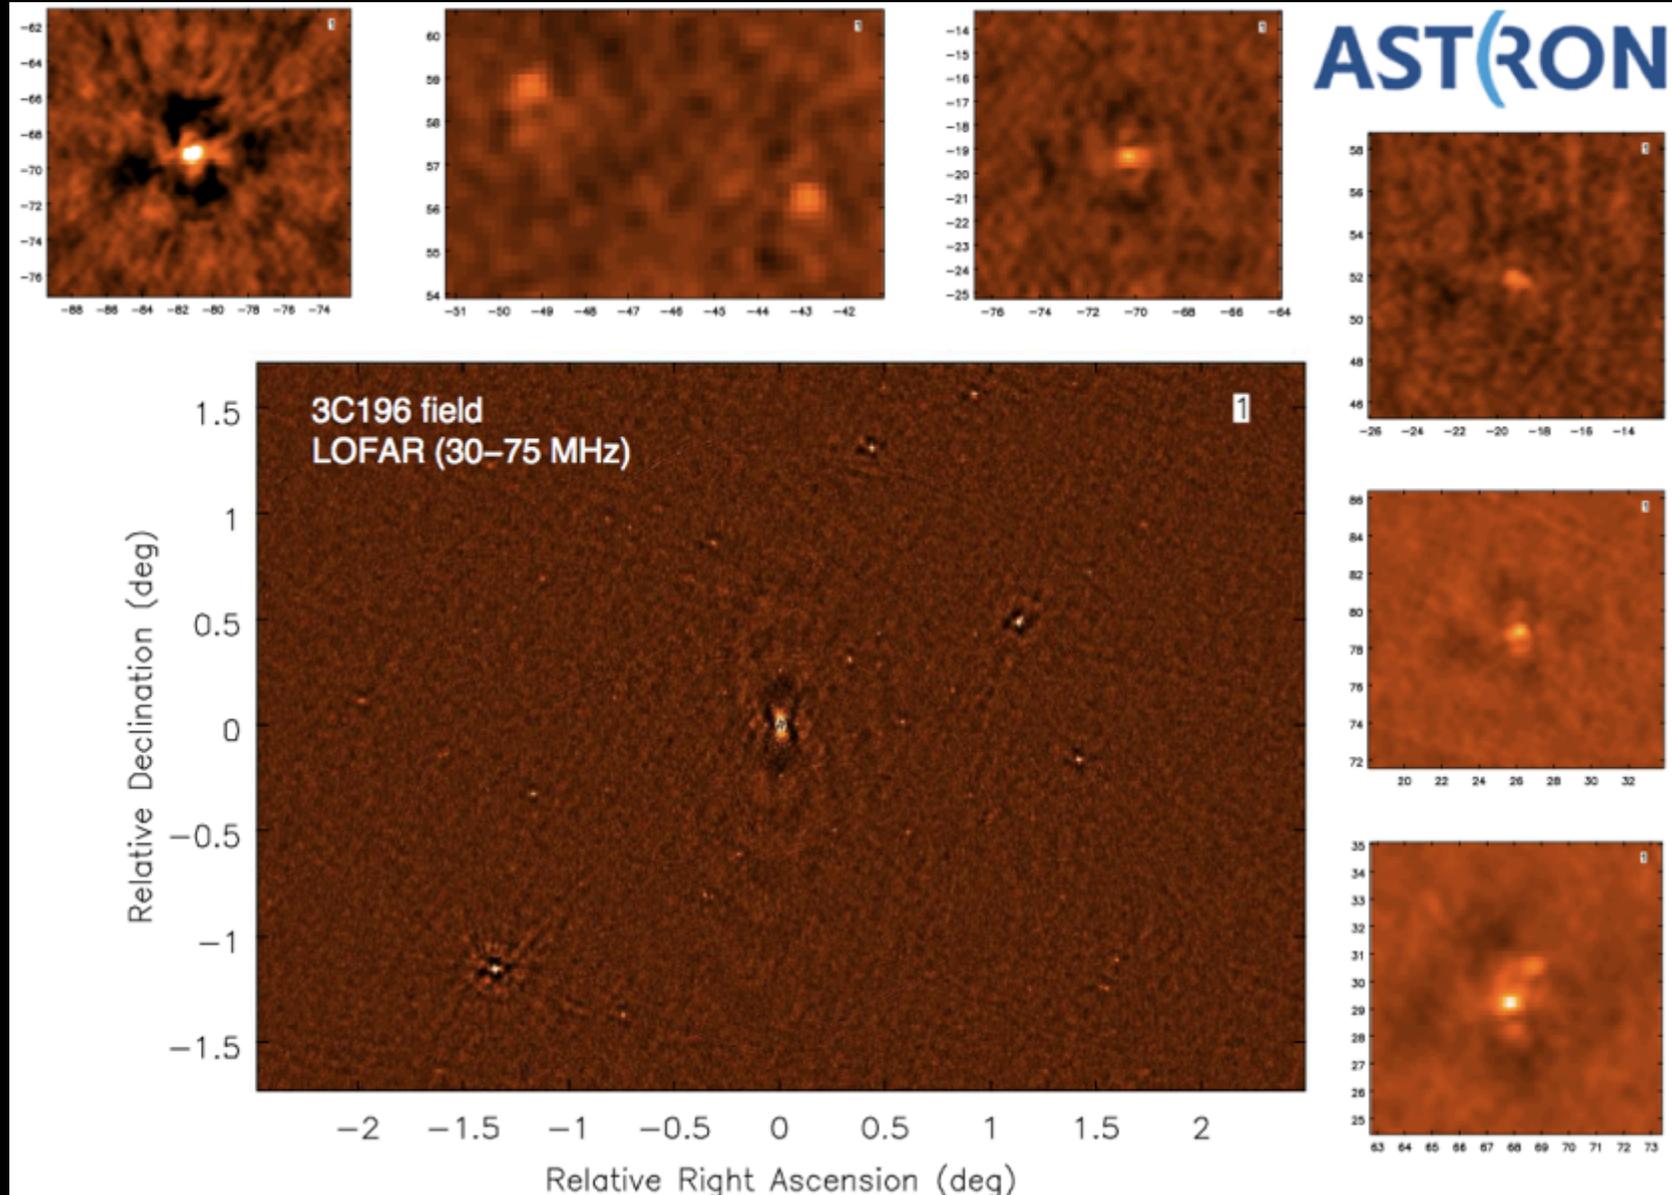

- LBA, filter 10-90 MHz
- 1 sec integration
- 11 stations (CS003,005,006,007,302,030,021 + RS106,208,307,503)
- 6 hr observation: data volume = 248 x 12 GB ~ 3.0 TB

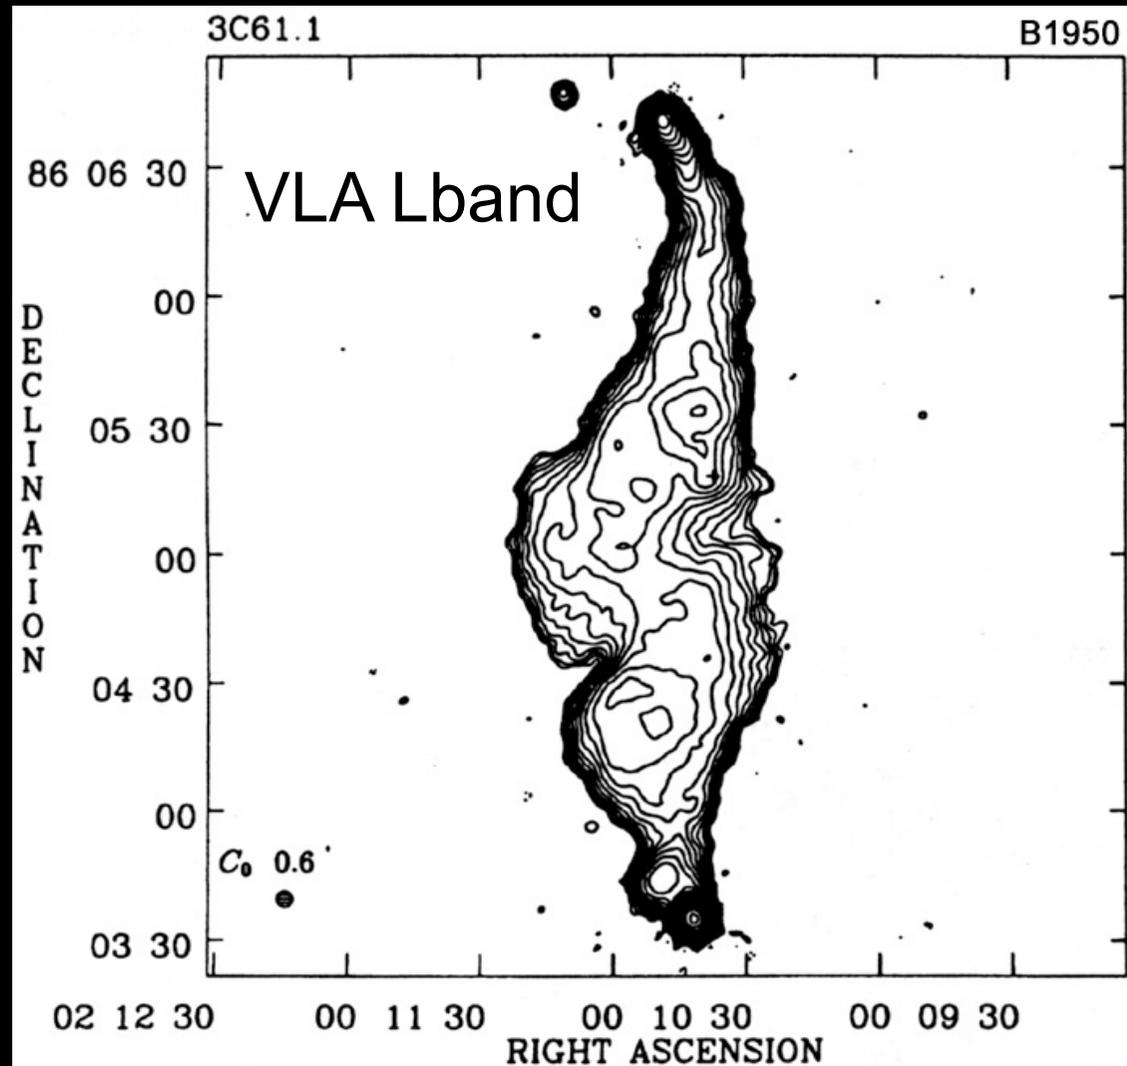

- Automated pipeline run:

McKean

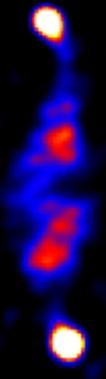

- HBA, filter 110-190 MHz; 16(x2)+4 stations; 1 subband; 60hr; 10"
- 3 (1) sec integration
- "20" stations (CS002,003,004,005,006,007,030,302 + RS106,208,307,503)
- 60 hr (in some subbands)  
SB to 122 GB, total ~ 4.6 TB

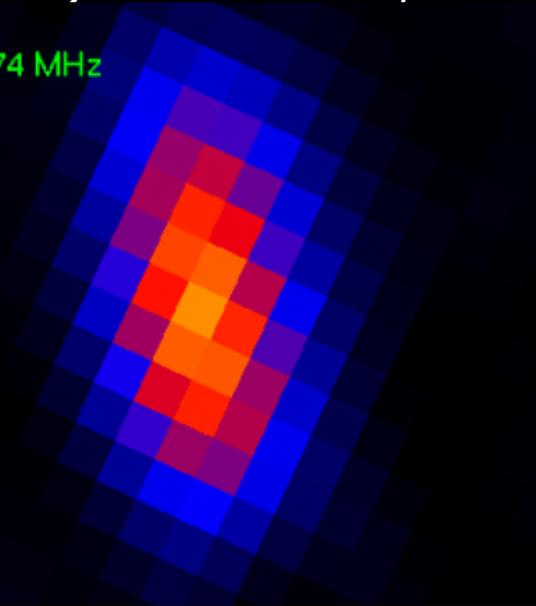

- HBA, filter 110-190 MHz; 16(x2)+4 stations; 1 subband; 60hr; 10"

11(x2)+5 stations; 6hr  
110"x110"; rms 1.6 mJy/beam

(work in progress; also by  
Monica Trasatti, an ASTRON  
summer student)

**Adebahr**

- LOFAR's interferometric mode is well exercised
  - ... works even on long ( $\sim 600\text{km}$ ) baselines at LBA frequencies
  - both point source fields and diffuse sources manageable
  - pipeline works as a pipeline (at present, individual components are usually used separately for commissioning purposes)
    - current efforts are geared toward truly blind automated usage, and subsequent update of GSM

- LOFAR's interferometric mode is well exercised
  - ... works even on long ( $\sim 600\text{km}$ ) baselines at LBA frequencies
  - both point source fields and diffuse sources manageable
  - pipeline works as a pipeline (at present, individual components are usually used separately for commissioning purposes)
    - current efforts are geared toward truly blind automated usage, and subsequent update of GSM
  
- Still lots to learn about imaging with LOFAR
  - Key system development will be station beam calibration
    - Increases sensitivity
    - Better calibration
    - Polarization
