

Storage & Processing clusters (a.o.)

Hanno Holties

MSSS Meeting, March 19, 2008

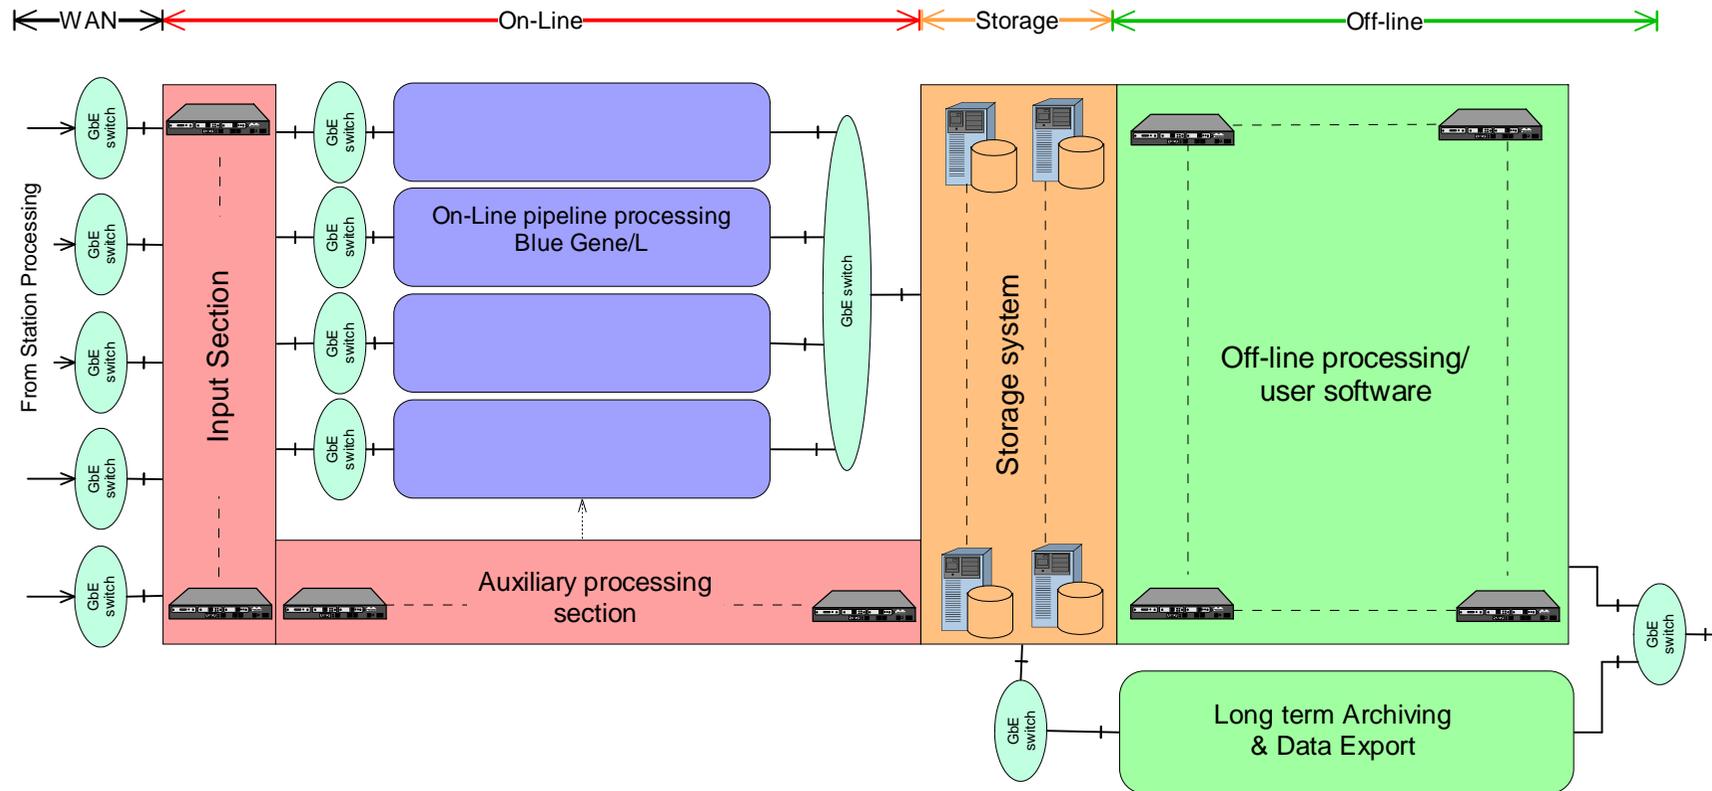

Current Status

Current Status

- ◆ Online storage CIT: 24 TB
- ◆ Offline storage CIT: 14 TB
- ◆ Offline processing:
 - ⊕ 18x 32 bit Xeon; 50 GB local
 - ⊕ 10x dual 64bit single core Opterons; ~400 GB local
- ◆ GRID based archive
 - ⊕ According to current policy mostly migrated to tape
 - ⊕ ~10 TB in use
- ◆ GRID based processing
 - ⊕ SARA Matrix cluster (36x Dual Xeon)
 - ⊕ CIT GRID cluster (50x 2 Dual Opteron)
- ◆ Local inspection
- ◆ Manual scheduling
- ◆ Manual data handling & inspection

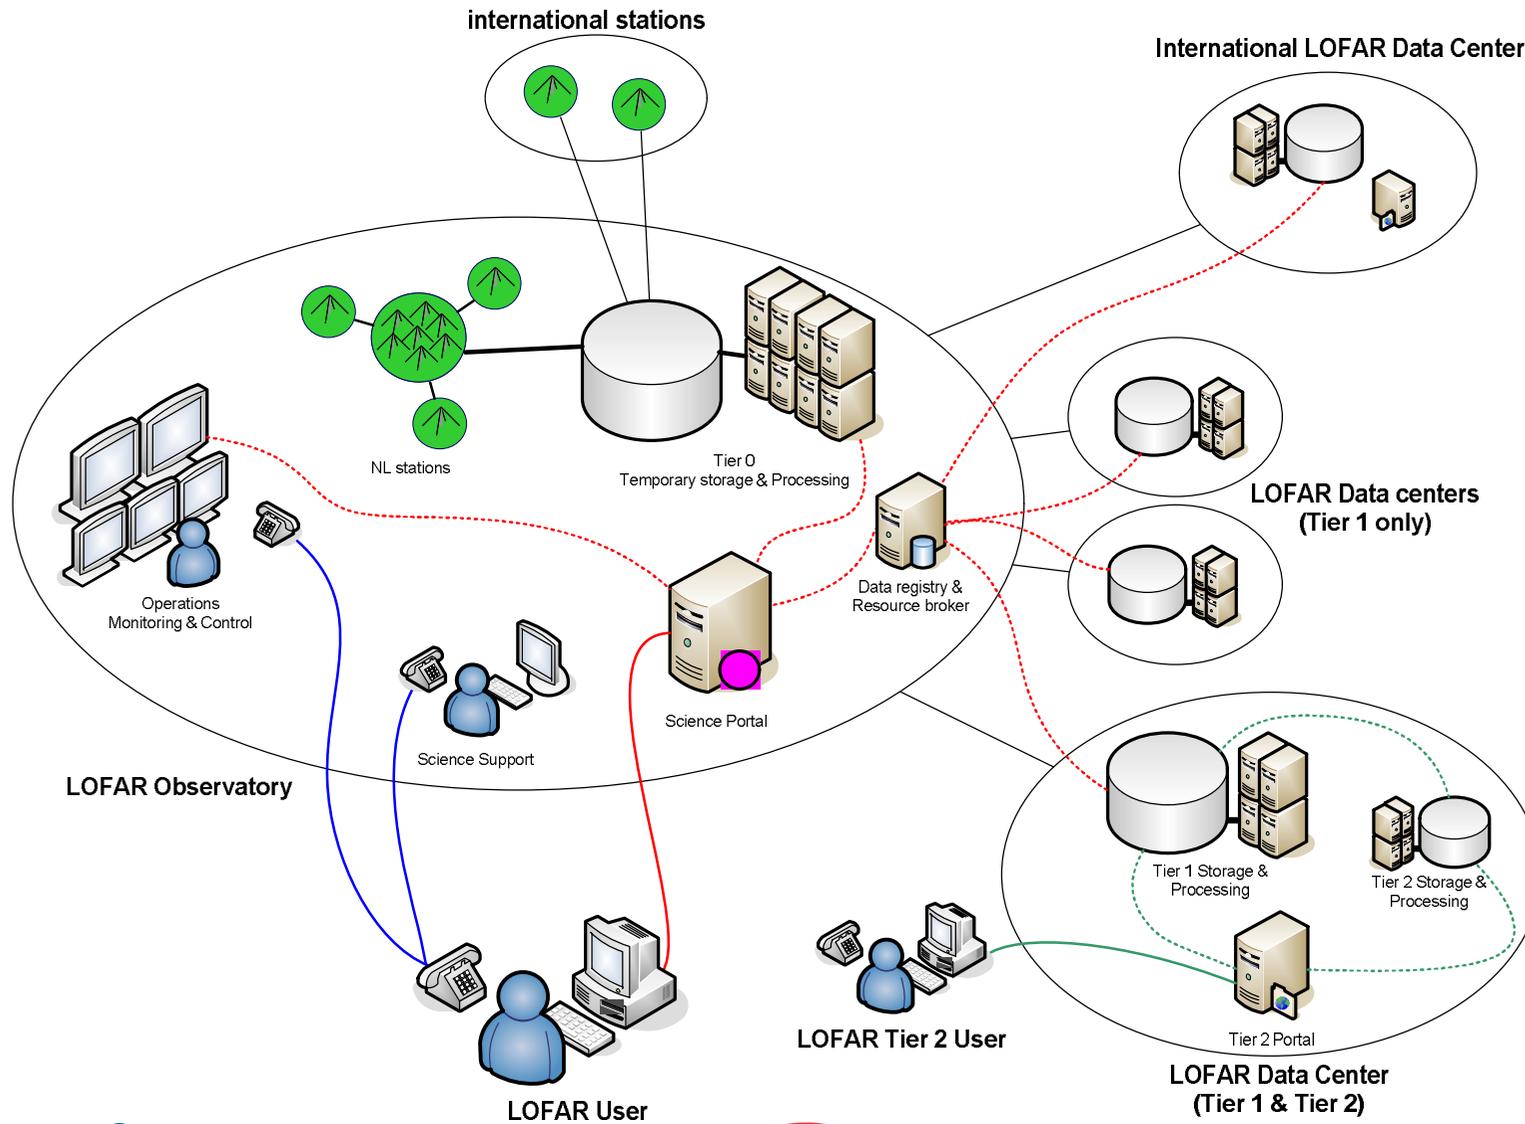

Working towards...

Spring 2009 Status...

- ◆ CEP storage & offline processing procured (Phase 1)
 - ⊖ Specs being defined
 - ⊖ Design includes 50 Gbps input & 100 Gbps output datarates
 - ⊖ Multiple 10 Gbps connections to computing centres
- ◆ GRID based storage & processing procured
 - ⊖ BiGGrid second tranche end 2008

Working towards...

Spring 2009: What is needed for MSSS

◆ MSSS requirements (?)

Assuming “100% efficiency”

⊕ Data generation ≤ 6 Gbps (≤ 500 TB/week)

⊕ Reduced (post DP³) data ≤ 15 TB

⊕ Offline computing power ???

◆ Operations:

⊕ Minimum requirements for system availability?

- # stations?
- # antennas/station?

Technical challenges

- ◆ Getting the cluster specs right...
- ◆ 30,000+ Observations to be scheduled
 - ⊕ Including offline processing
 - ⊕ High level of automation required
- ◆ Observation catalogue
- ◆ 10,000+ Data products to be archived
 - ⊕ Images
 - ⊕ Reduced UV data?
 - ⊕ Raw UV data???
 - ⊕ Public?
- ◆ ~2,500,000 Sources in catalogue

Sleepless nights

- ◆ Planning & integration
- ◆ System robustness & stability
- ◆ Is system “Operations” ready?
