

Cygnus A

- Previously CygA was not visible in the corrected image
- Previously: Used only inter-station baselines
- Now: Flag everything with $\text{sqr}(U) + \text{sqr}(V) < 100$

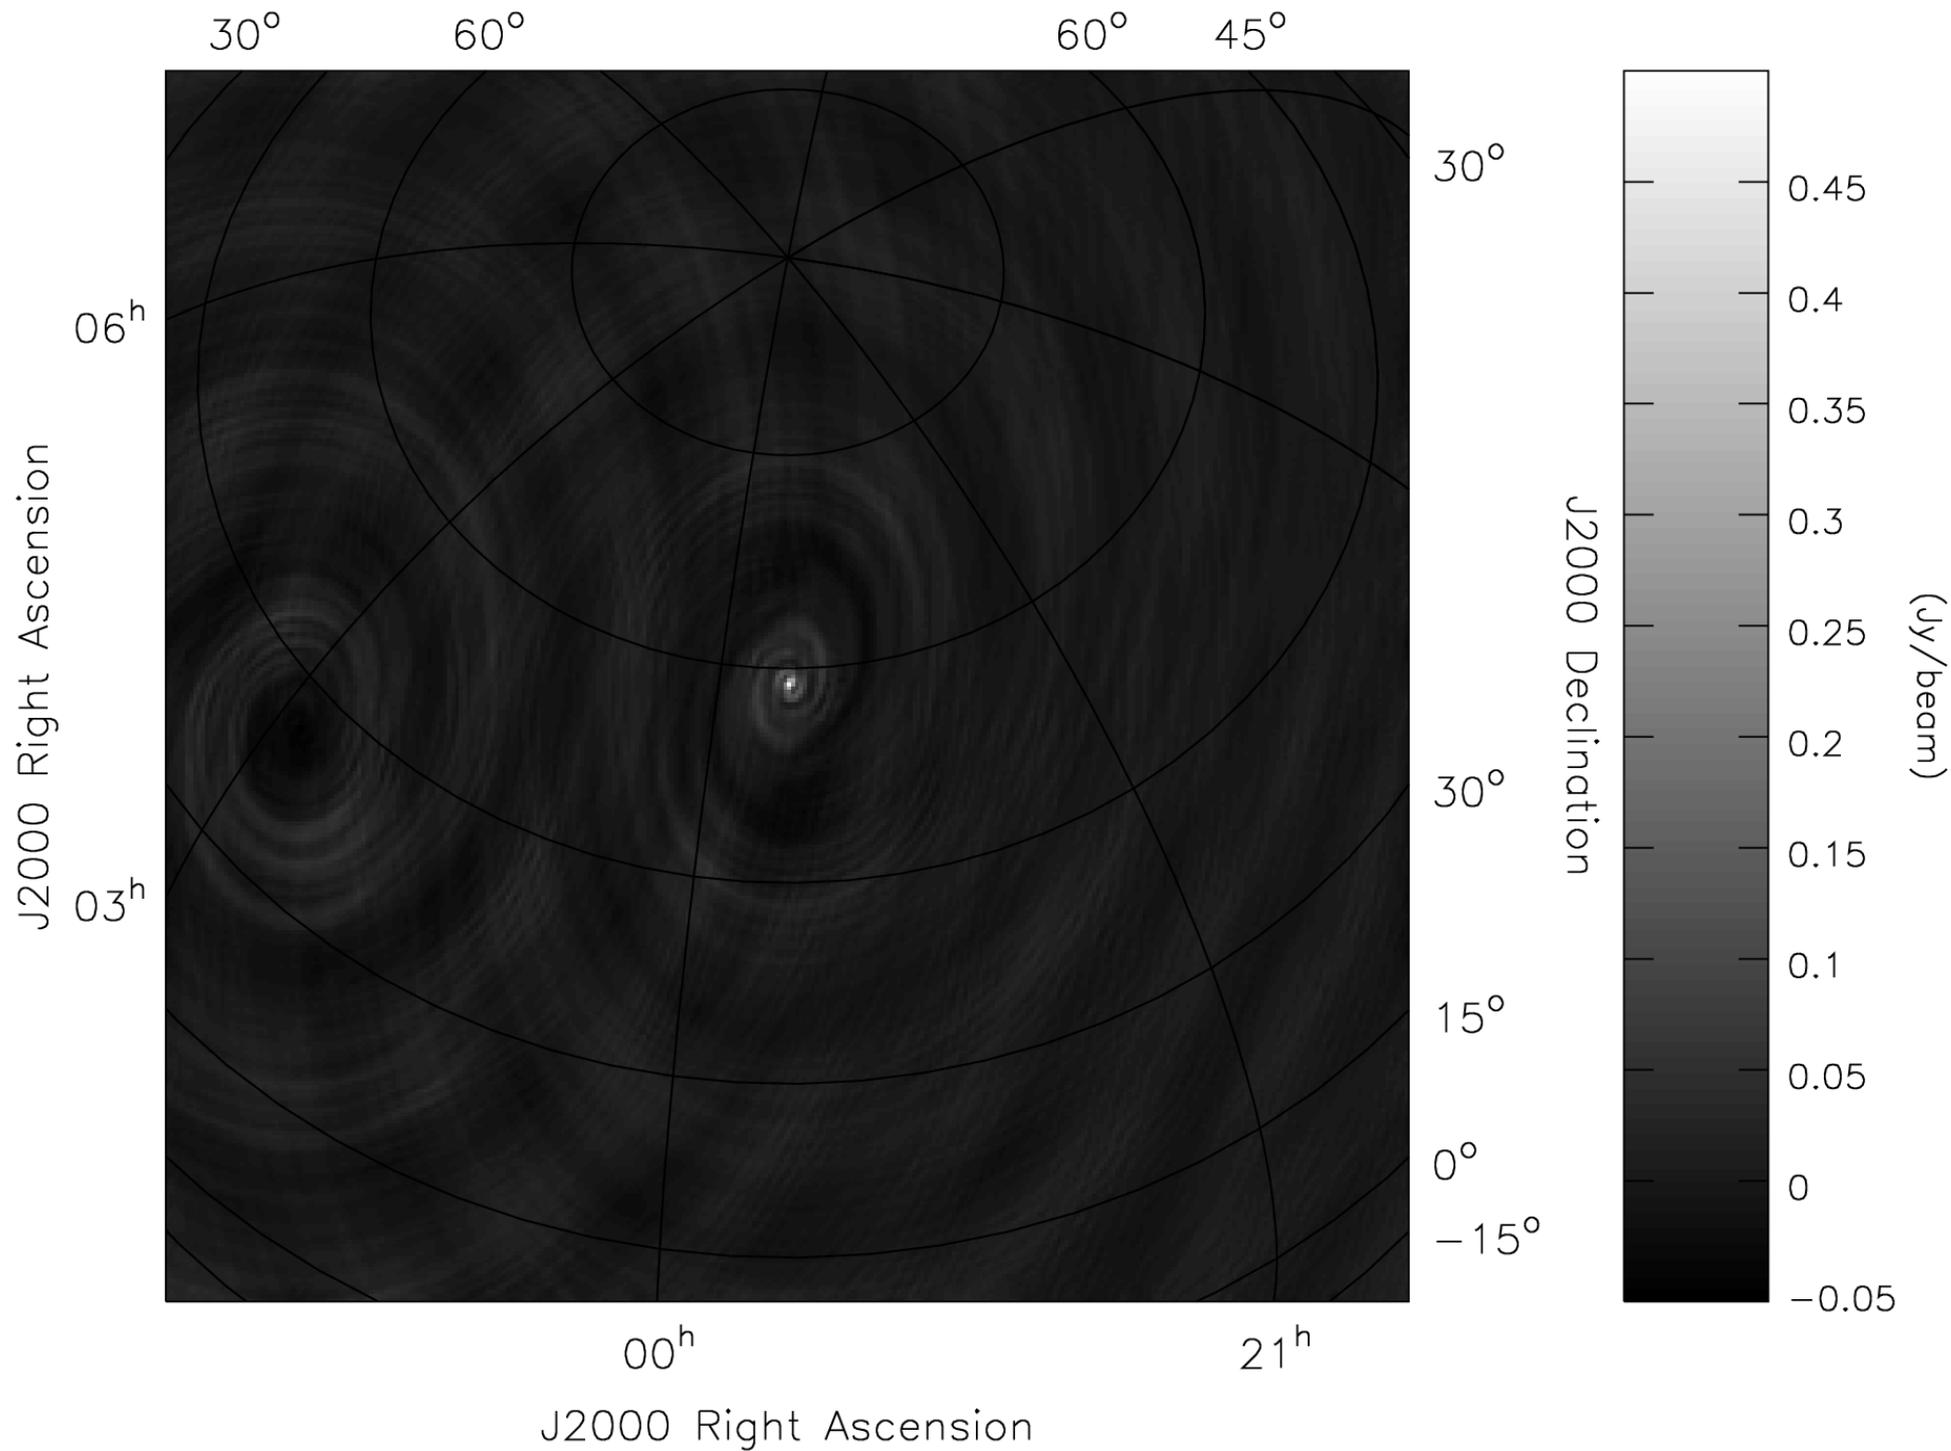

UVW

- UVW in CS1 MS are sign-flipped with respect to WSRT MS
- BBS uses WSRT (AIPS++) convention for the predict
- Introduced two flags: read/compute UVW and flip/don't flip UVW

Read UVW

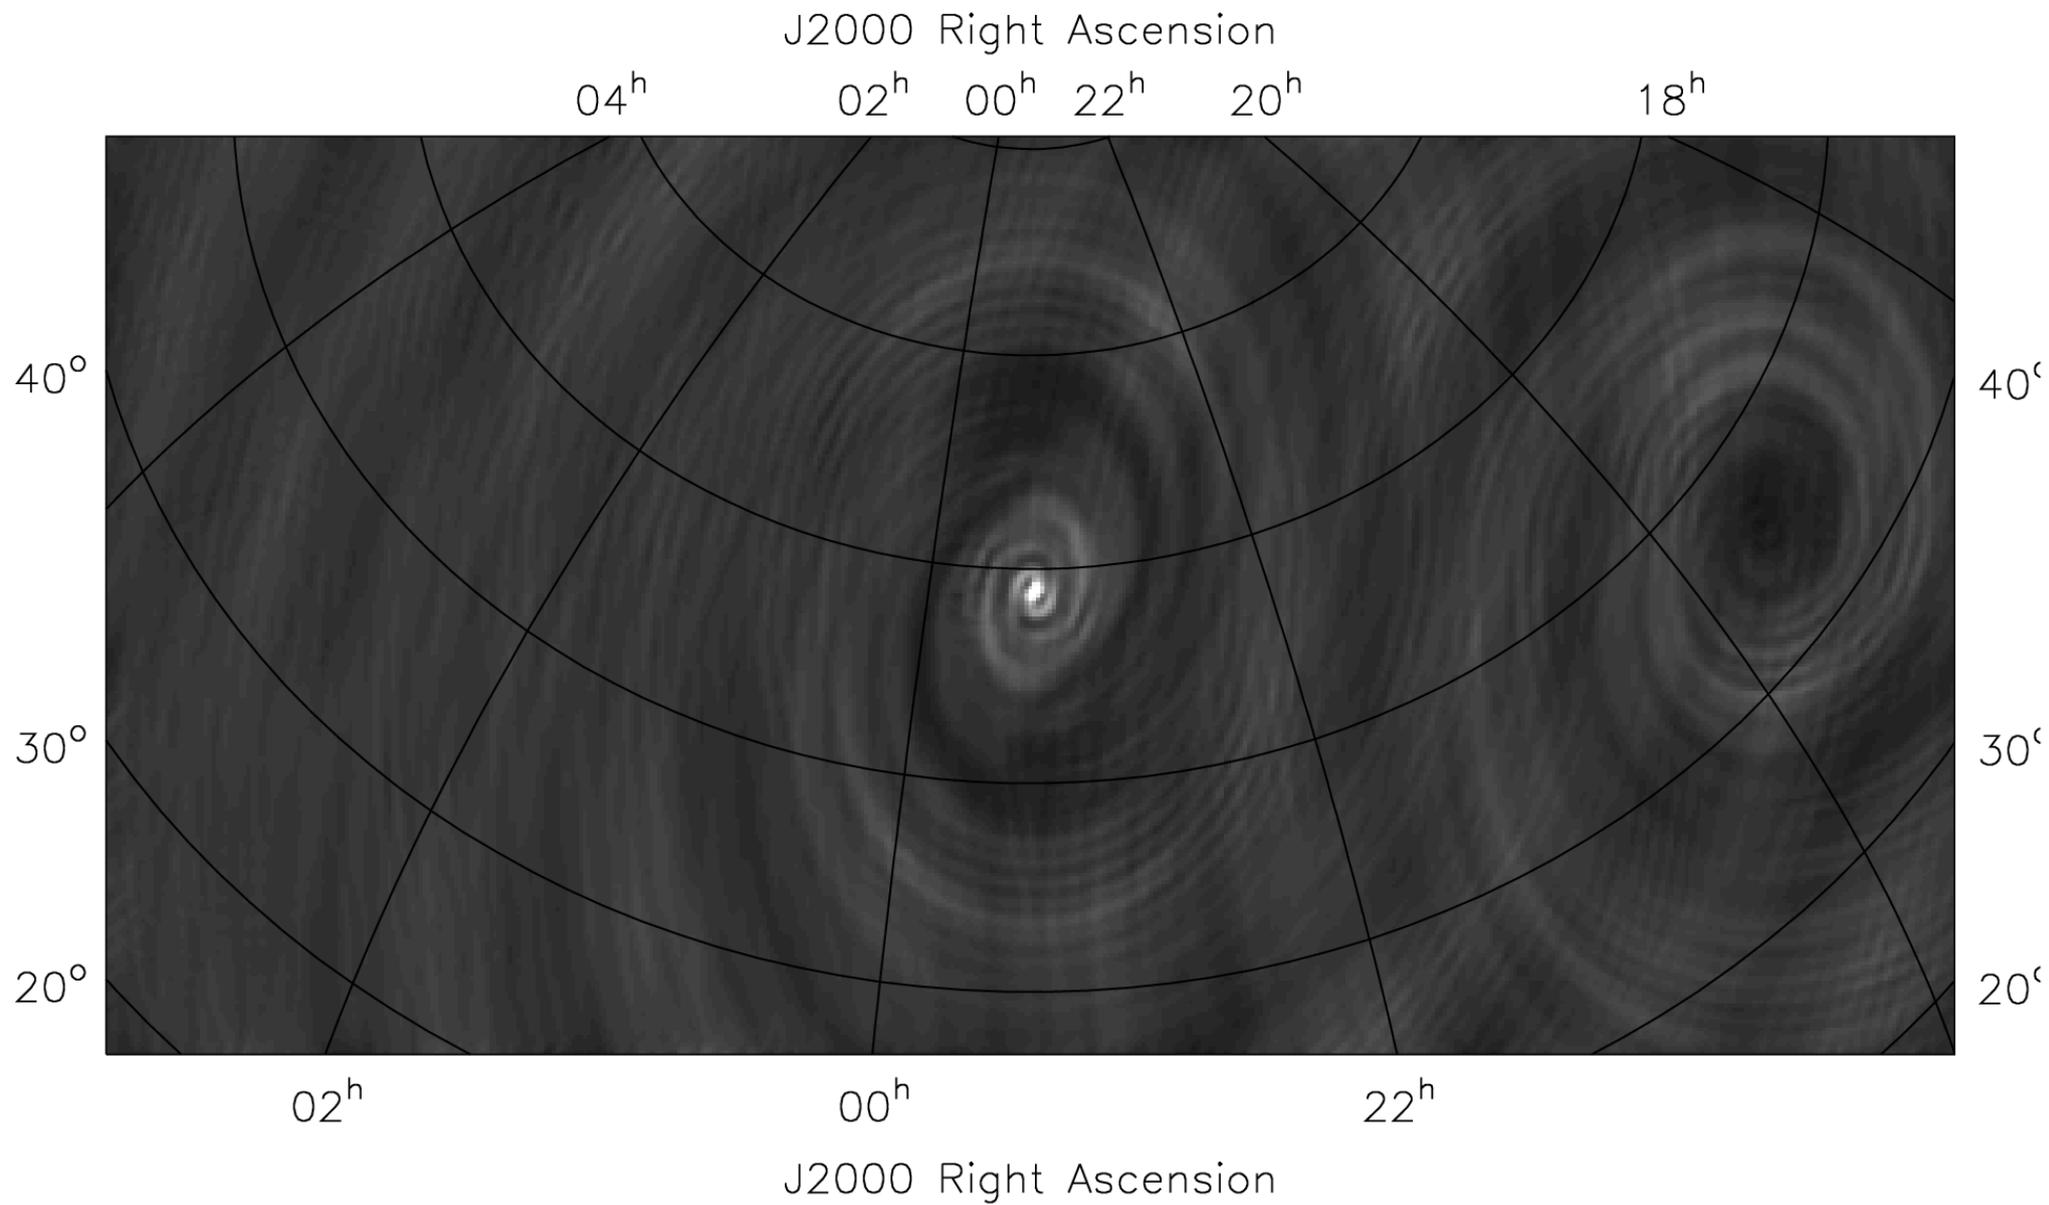

Read UVW; Flip

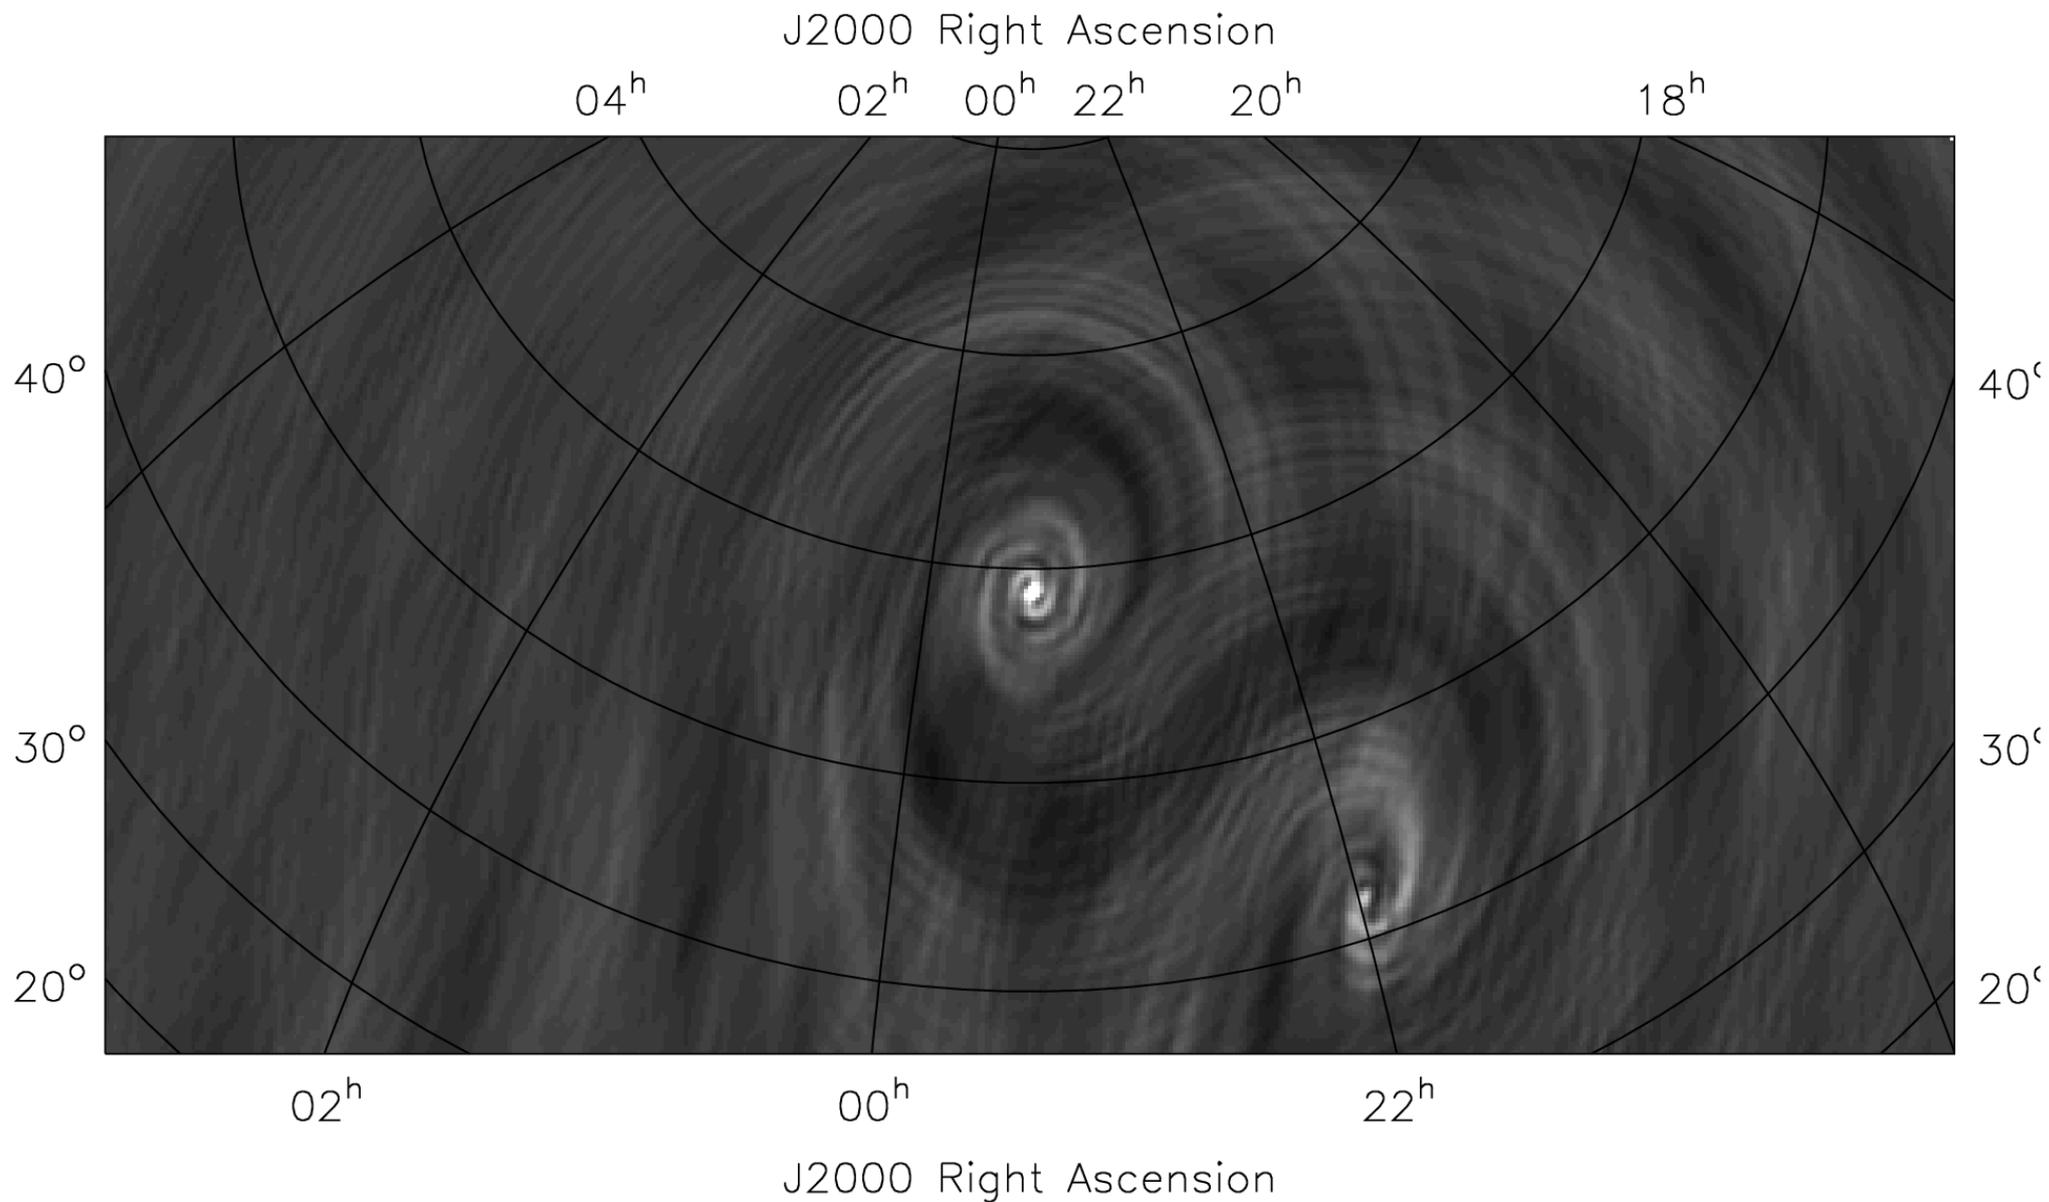

Clean Predict

- CygA has a negative peak
- CygA is at the wrong position
- Try to reproduce using AIPS++

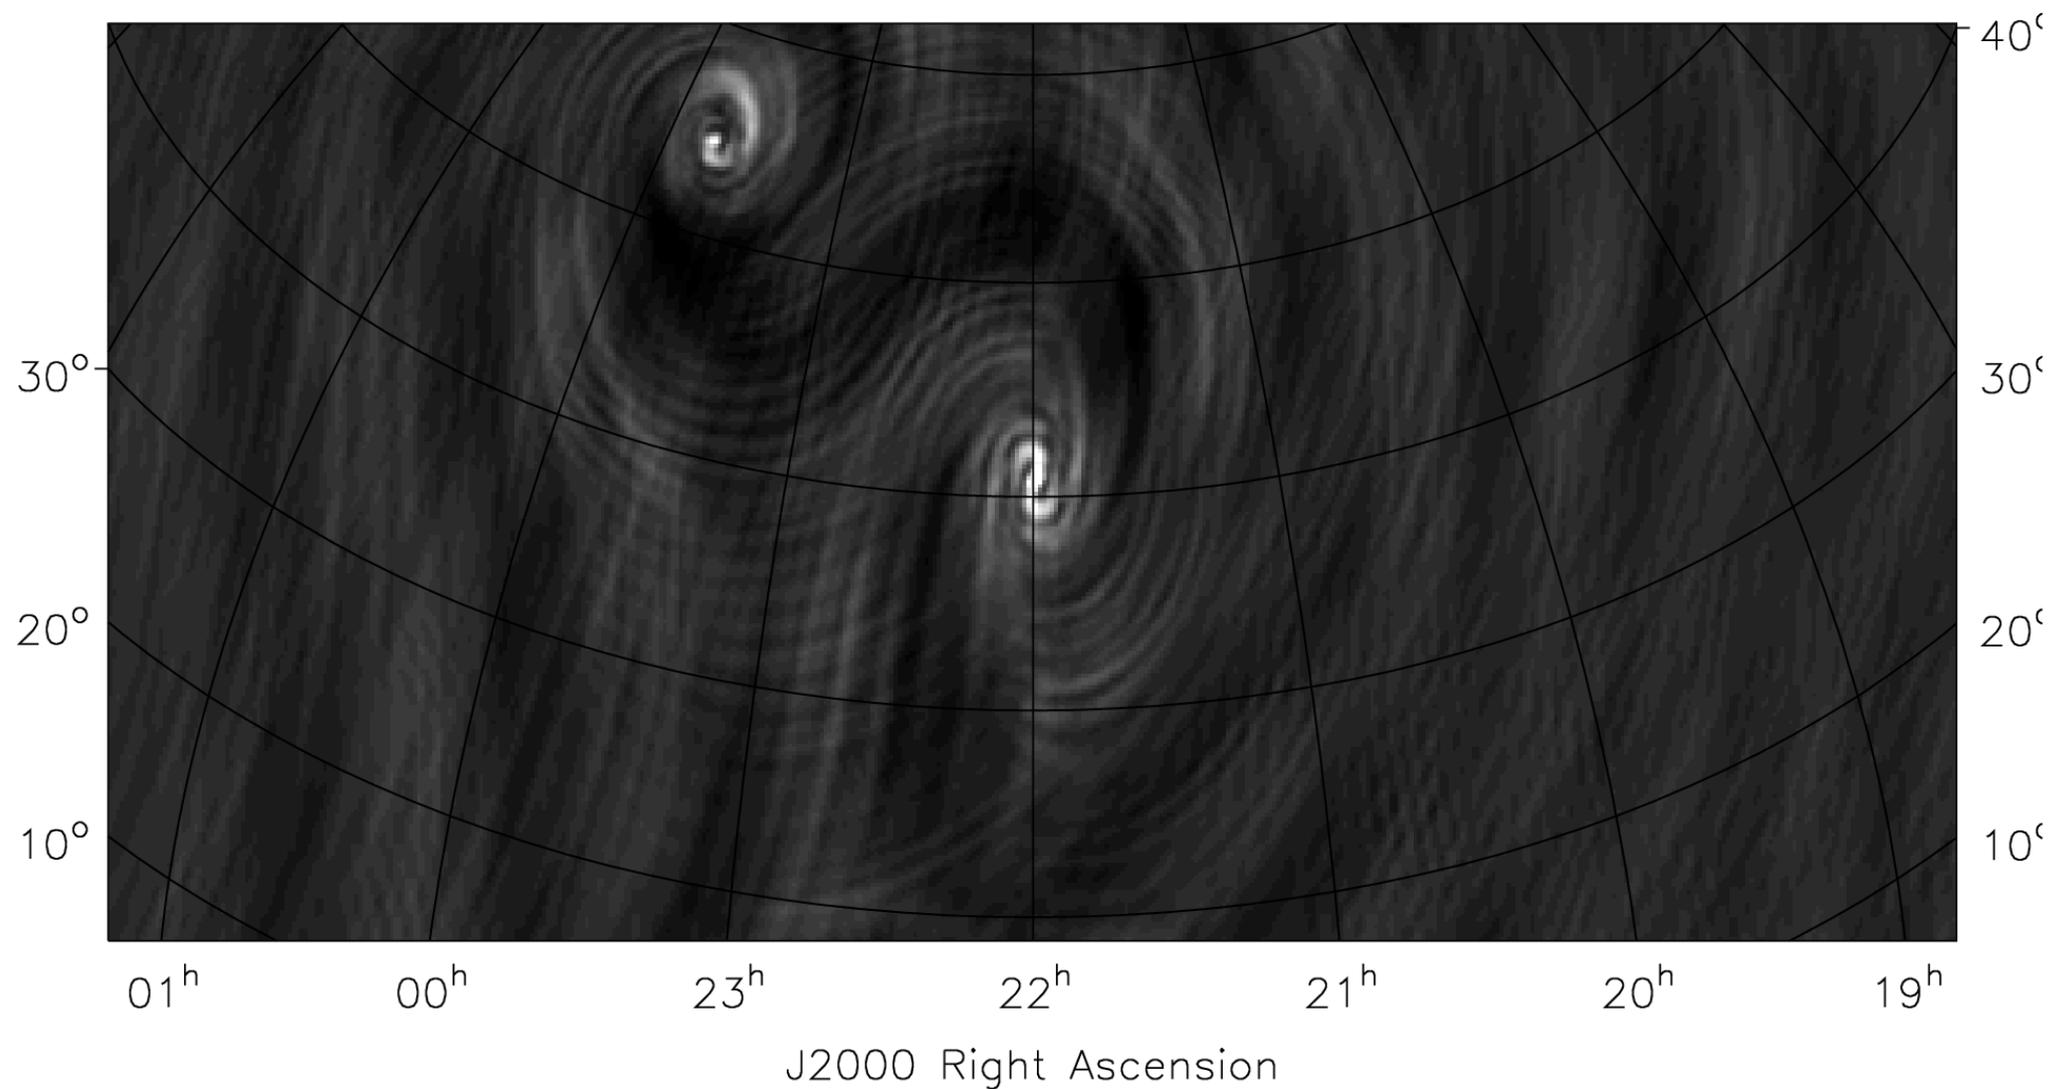

AIPS++ Predict

AIPS++ Predict; W-Projection

Phase shift; W-Projection

More tests...

- Try to reproduce Sarod's results with MeqTree
- Compare solutions against MeqTree
- Try to understand the AIPS++ imager
