

Ionospheric Activity

- Work/Study Group goals
 - Some new results

Ger de Bruyn

LSM 7 Mar 2012

ISG activities

Members: Ger, Bas, Maaijke, Ilse, Jan, Leon, Soobash, Charlotte, Harish,..

Goals:

- screen modeling across FOV, stabilizing images
- absolute TEC & RM for pulsars and wide field polarimetry
- assess day/night differences (ionospheric scintillation, IPS)
- limitations due to amplitude scintillation ?

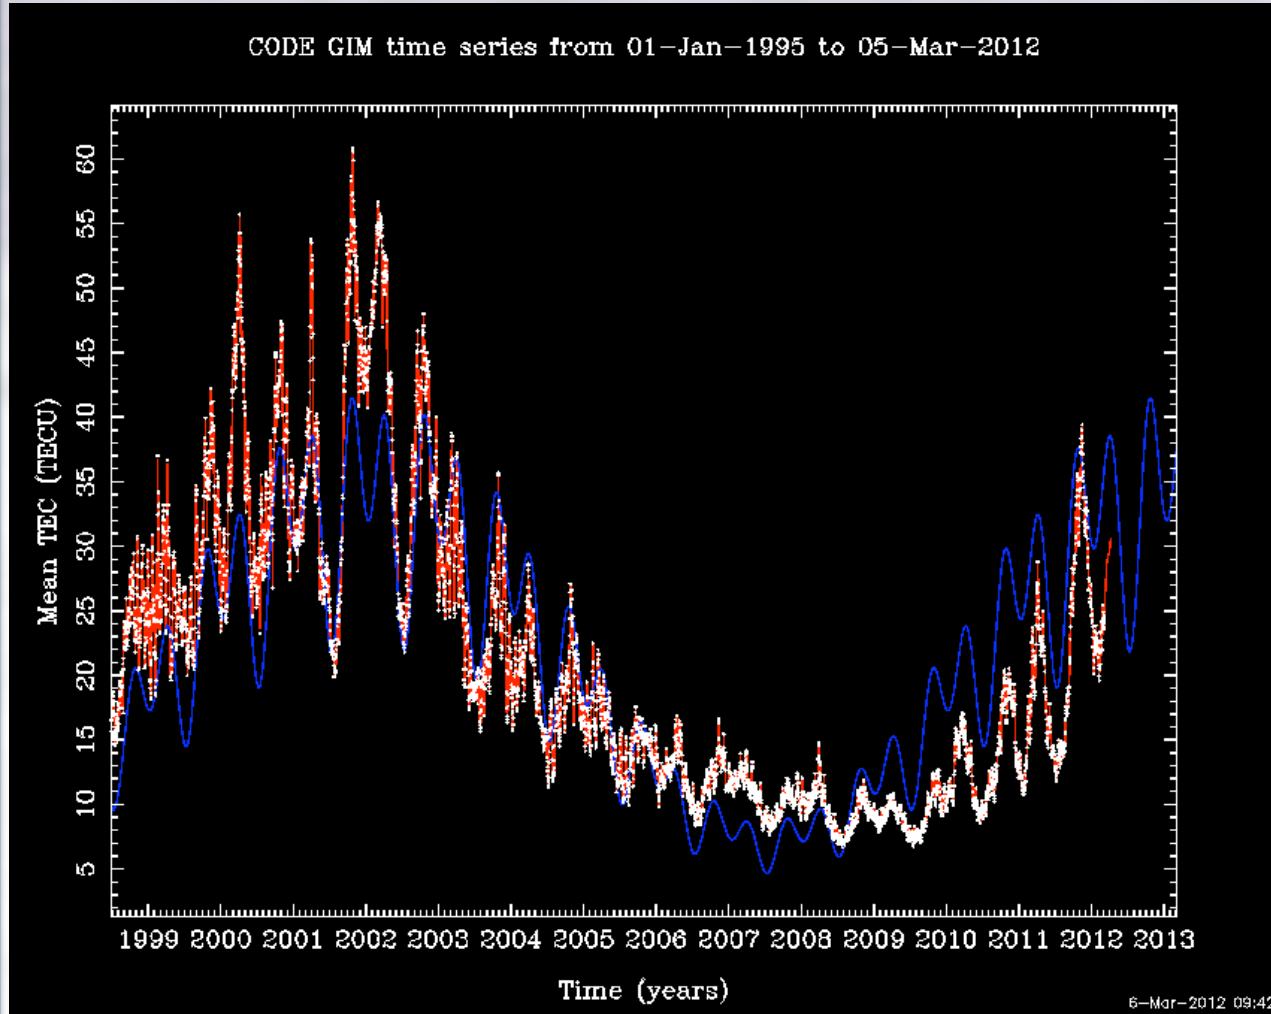

Some new results:

- Solar activity and thickening TEC layer
- using pulsars → ionospheric RM (Charlotte): accuracy $0.1 \rightarrow 0.01 \text{ rad/m}^2$
- using SAGEcal to map out ionospheric DD-effects (Sarod, Soobash)
- using MSSS LBA results to determine ionospheric refraction (Ger)

Critical tasks:

- develop link from data to screen models (2D & 3D) (SAGEcal, multi-beam obs)
- applying screen models in Aimager → Bas van der Tol movie
- procedure to link differential and absolute TEC info and modeling

Average (global) TEC thickness increases rapidly

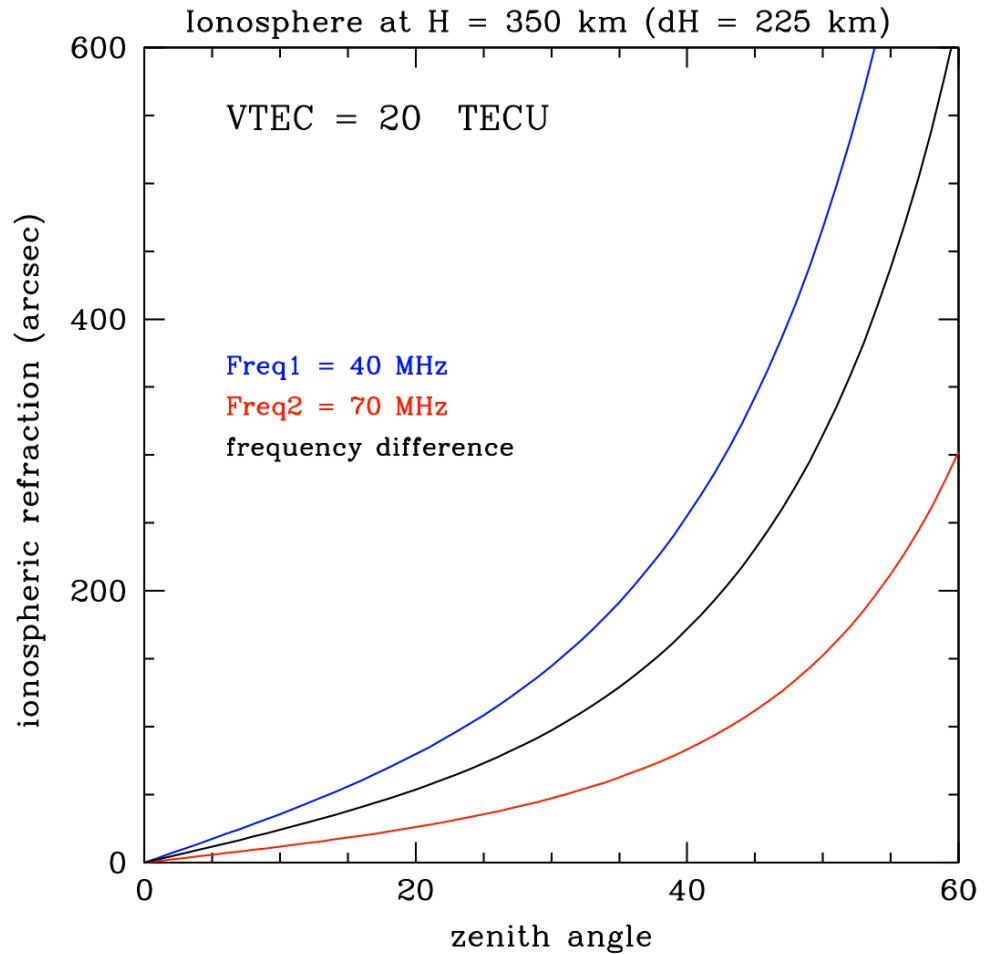

White: data

Red: 30-day prediction

Blue: trend function
(with 11-year, annual
and semi-annual
components)

From: CODE- Bern

..which leads to large refractive effects in the LBA band

Differential effects, varying with frequency, in

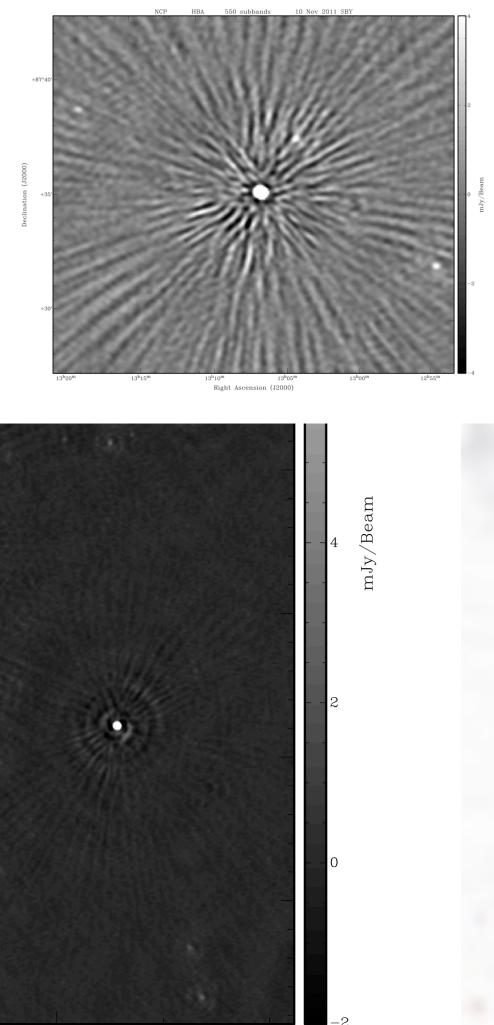

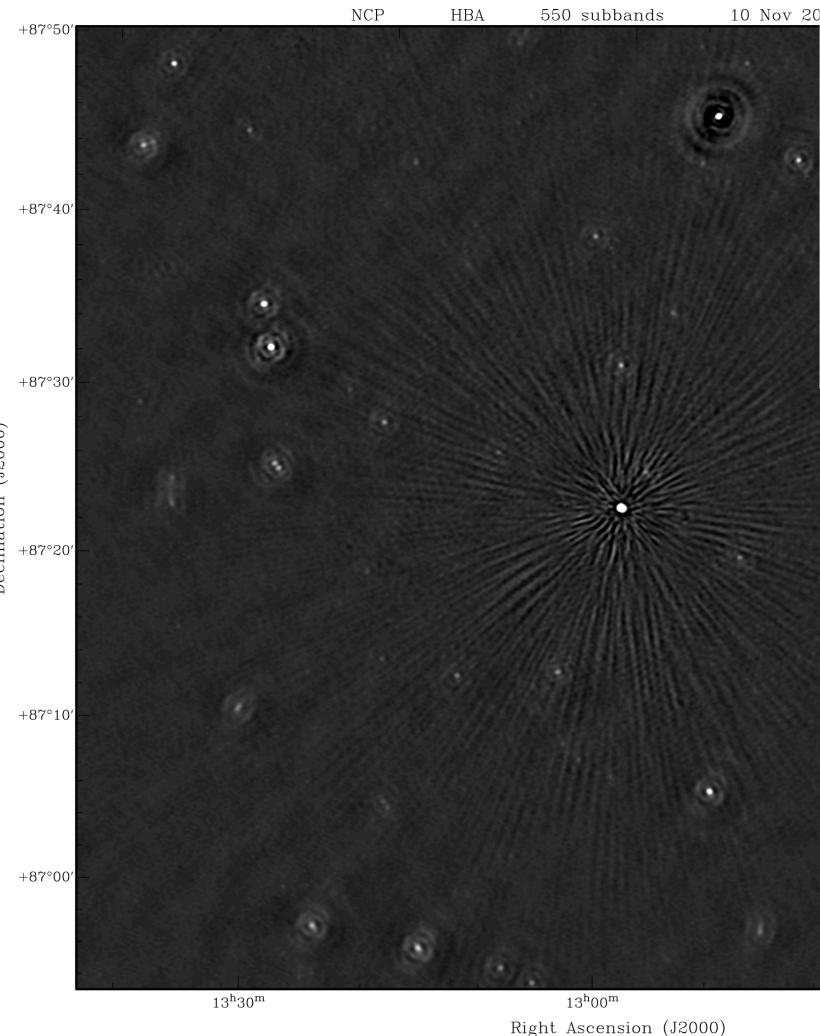

- time → selfcal
- position → effect on model (= DDE) !

...and residual effects in images)
