IONOSPHERIC EVENT 22-01-2012

Contact: iono@oma.be

An interplanetary shock wave was detected by ACE the 22/01/2012 at 05:15 UT (source: www.sidc.be). The Earth's ionosphere above Europe was disturbed from the 22/01/2012 at 06:00 UT to the 23/01/2012 at 05:30 UT.

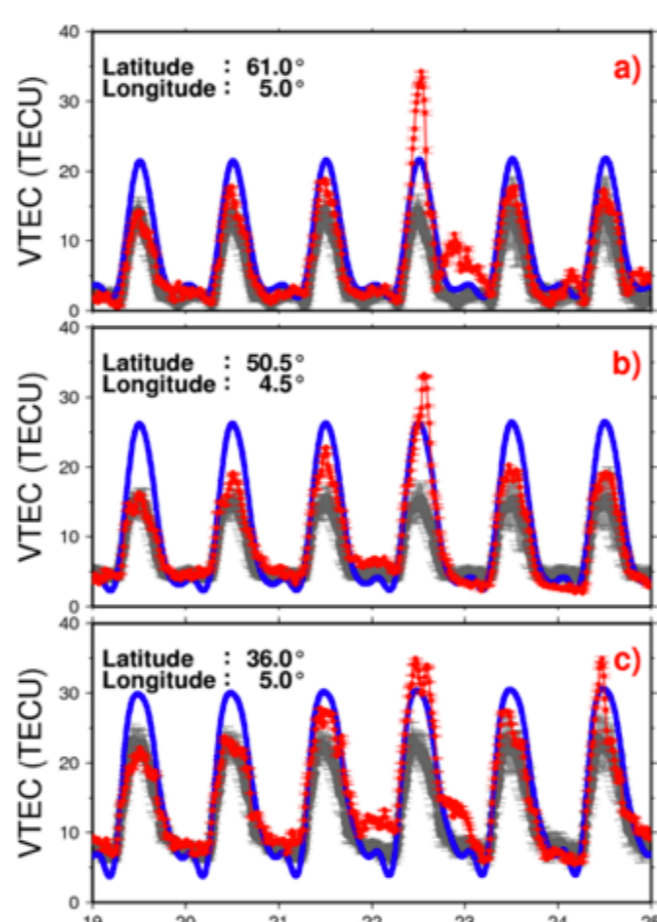

Figure 1: VTEC time series

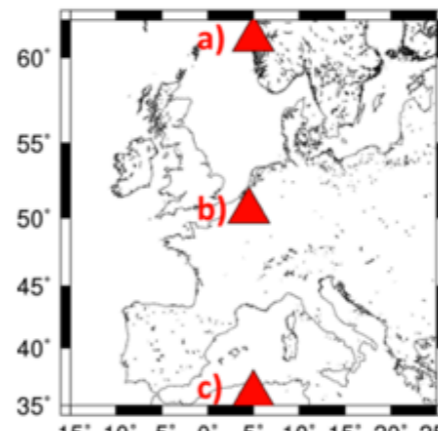

Figure 2: Map of the 3 locations

Figure 1 shows the time evolution of the [Vertical Total Electron Content \(VTEC\)](#) time series (*in red*) extracted from the near-real time 15-min VTEC maps at 3 different locations (see Figure 2):

- a) Northern part of the map (top)
- b) Brussels (middle)
- c) Southern part of the map (bottom)

Also shown, the model based on the median from the 15 previous days (*in grey*), and the IRI 2011 [Bilitza et al. 2011] model (*in blue*).

More informations:

- the 15 min VTEC maps during this event : [here](#)
- comparison with the median of the last 15 days : [here](#)
- about the CME : www.sidc.be

- New reports available since last LSM:

2012 Week 8

Present: Oscar Martinez, Mike Bell, Tom Hassall, Gosia Pietka, Jess Broderick

-  [Report](#) on the analysis of demixed data for the L227+69 field at 74 MHz (Michael Bell, Tom Hassall and George Heald)
-  [Report](#) on the analysis of the L227+69 and L243+69 fields at 60 MHz (Jess Broderick and Gosia Pietka)

2012 Week 9

Present: Oscar Martinez, V.N. Pandey, Charlotte Sobey, Björn Adebahr, Yvette Cendes, Peeyush Prasad

-  [Report](#) on L086+69 and 3C196 (Björn Adebahr)
-  [Report](#) on overlapping fields L227+69 and L243+69 (Charlotte Sobey & Yvette Cendes)
-  [Report](#) on TEC calibration of L227+69 (Peeyush Prasad)
-  [pandeymartinez-week9-v1p1.pdf](#) on automatic baseline statistics and detection of bad stations (Oscar Martinez & V.N. Pandey)

- Keep up-to-date on the LOFAR wiki (MSSS section) - note that progress reports are typically posted on Monday following the previous week's work

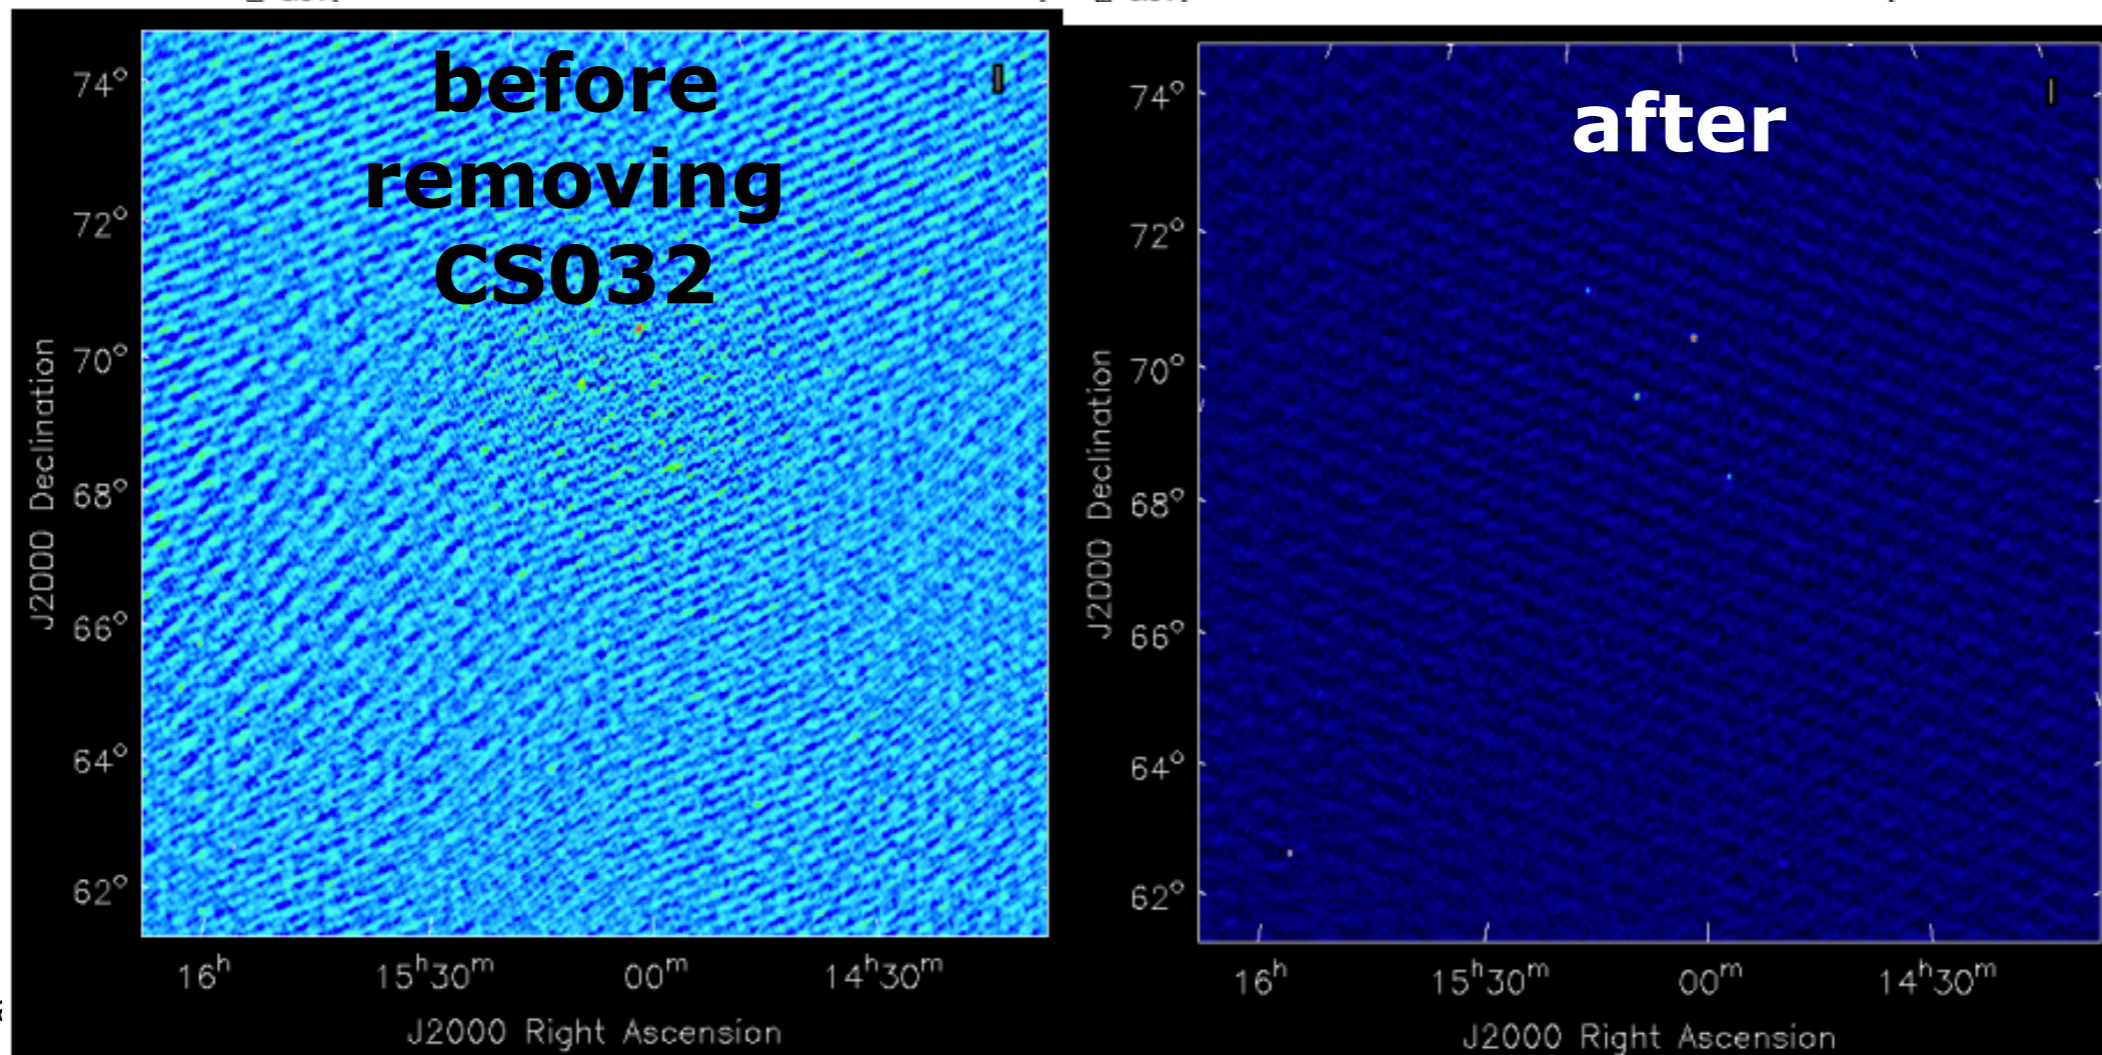

- ID and removal of badly behaving stations
- Data processing is almost entirely automated
 - small set of scripts to go from demixed pipeline data to a set of 8 2-MHz broadband images covering 30-74 MHz, each of which are approx. near VLSS resolution, sensitivity (no selfcal yet)
 - these scripts are informing further pipeline development
- Images made with awimager now regularly produced
 - field-to-field consistency indicates array beam ok to first order
 - potential MSSS-to-VLSS inconsistency may be due to a subtle processing error, needs to be verified

- Key step: identification and removal of bad stations

**Gain
amplitudes**

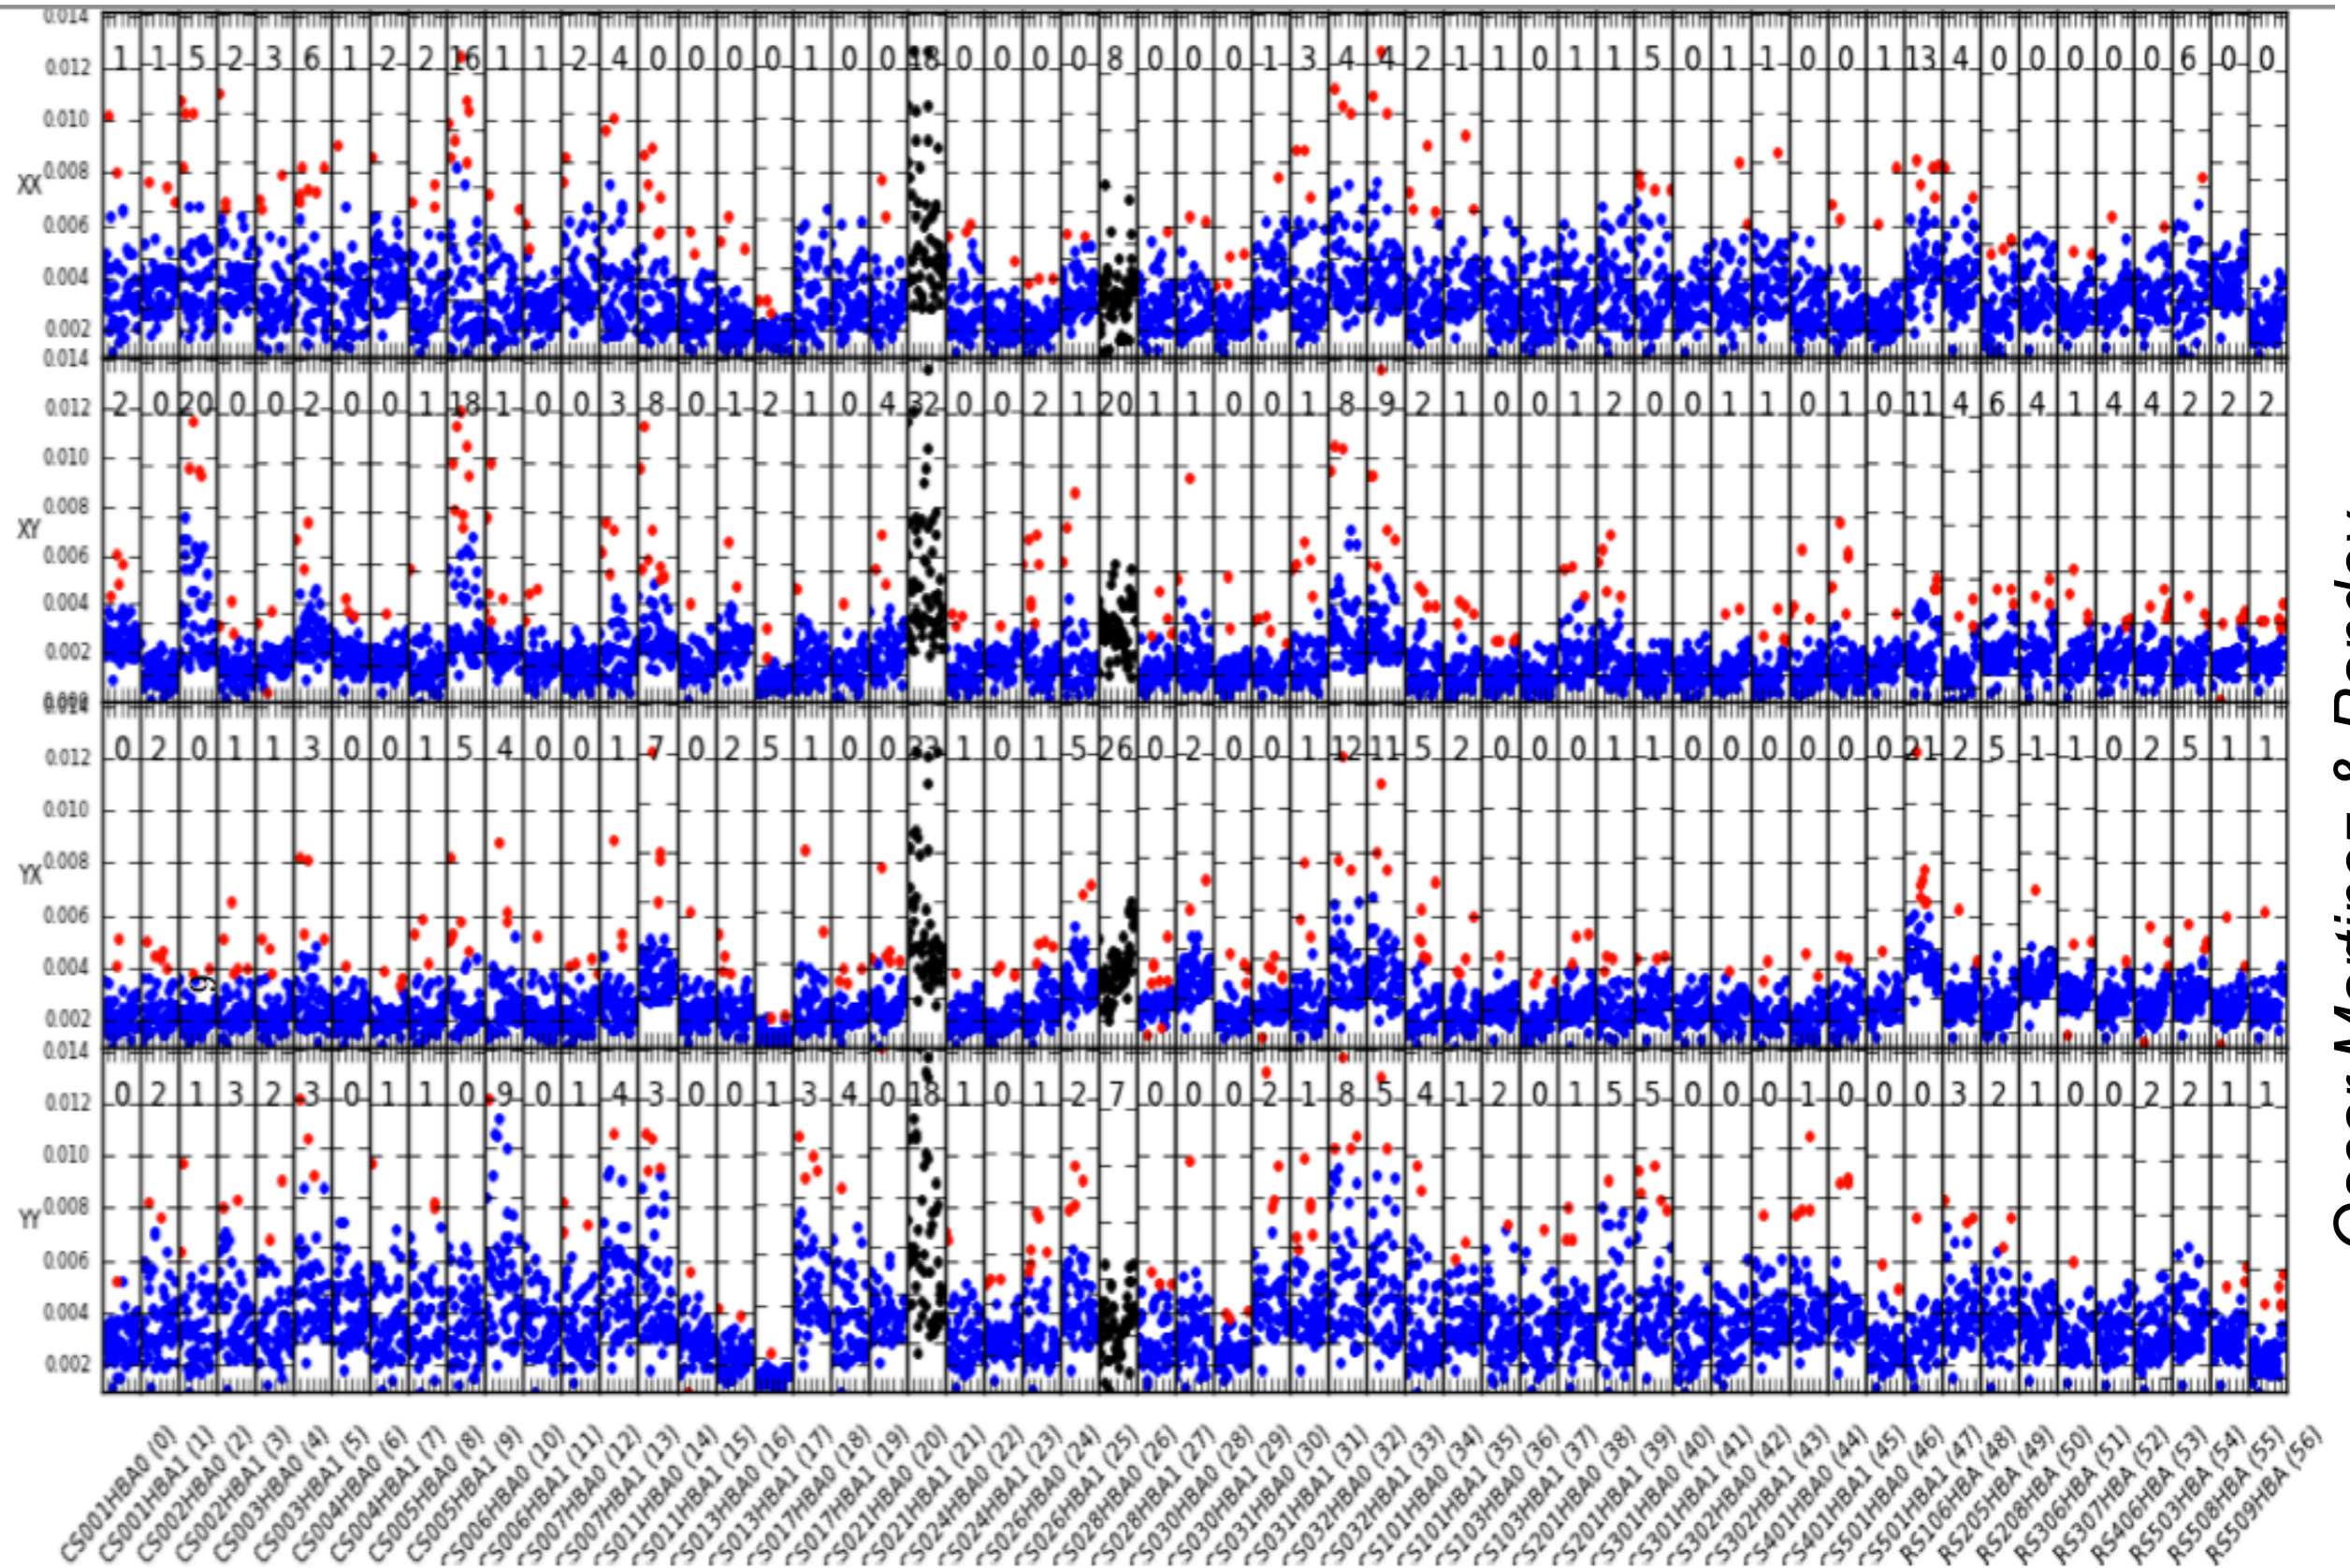

*Mike Bell &
Tom Hassall*

I. Removal of bad stations

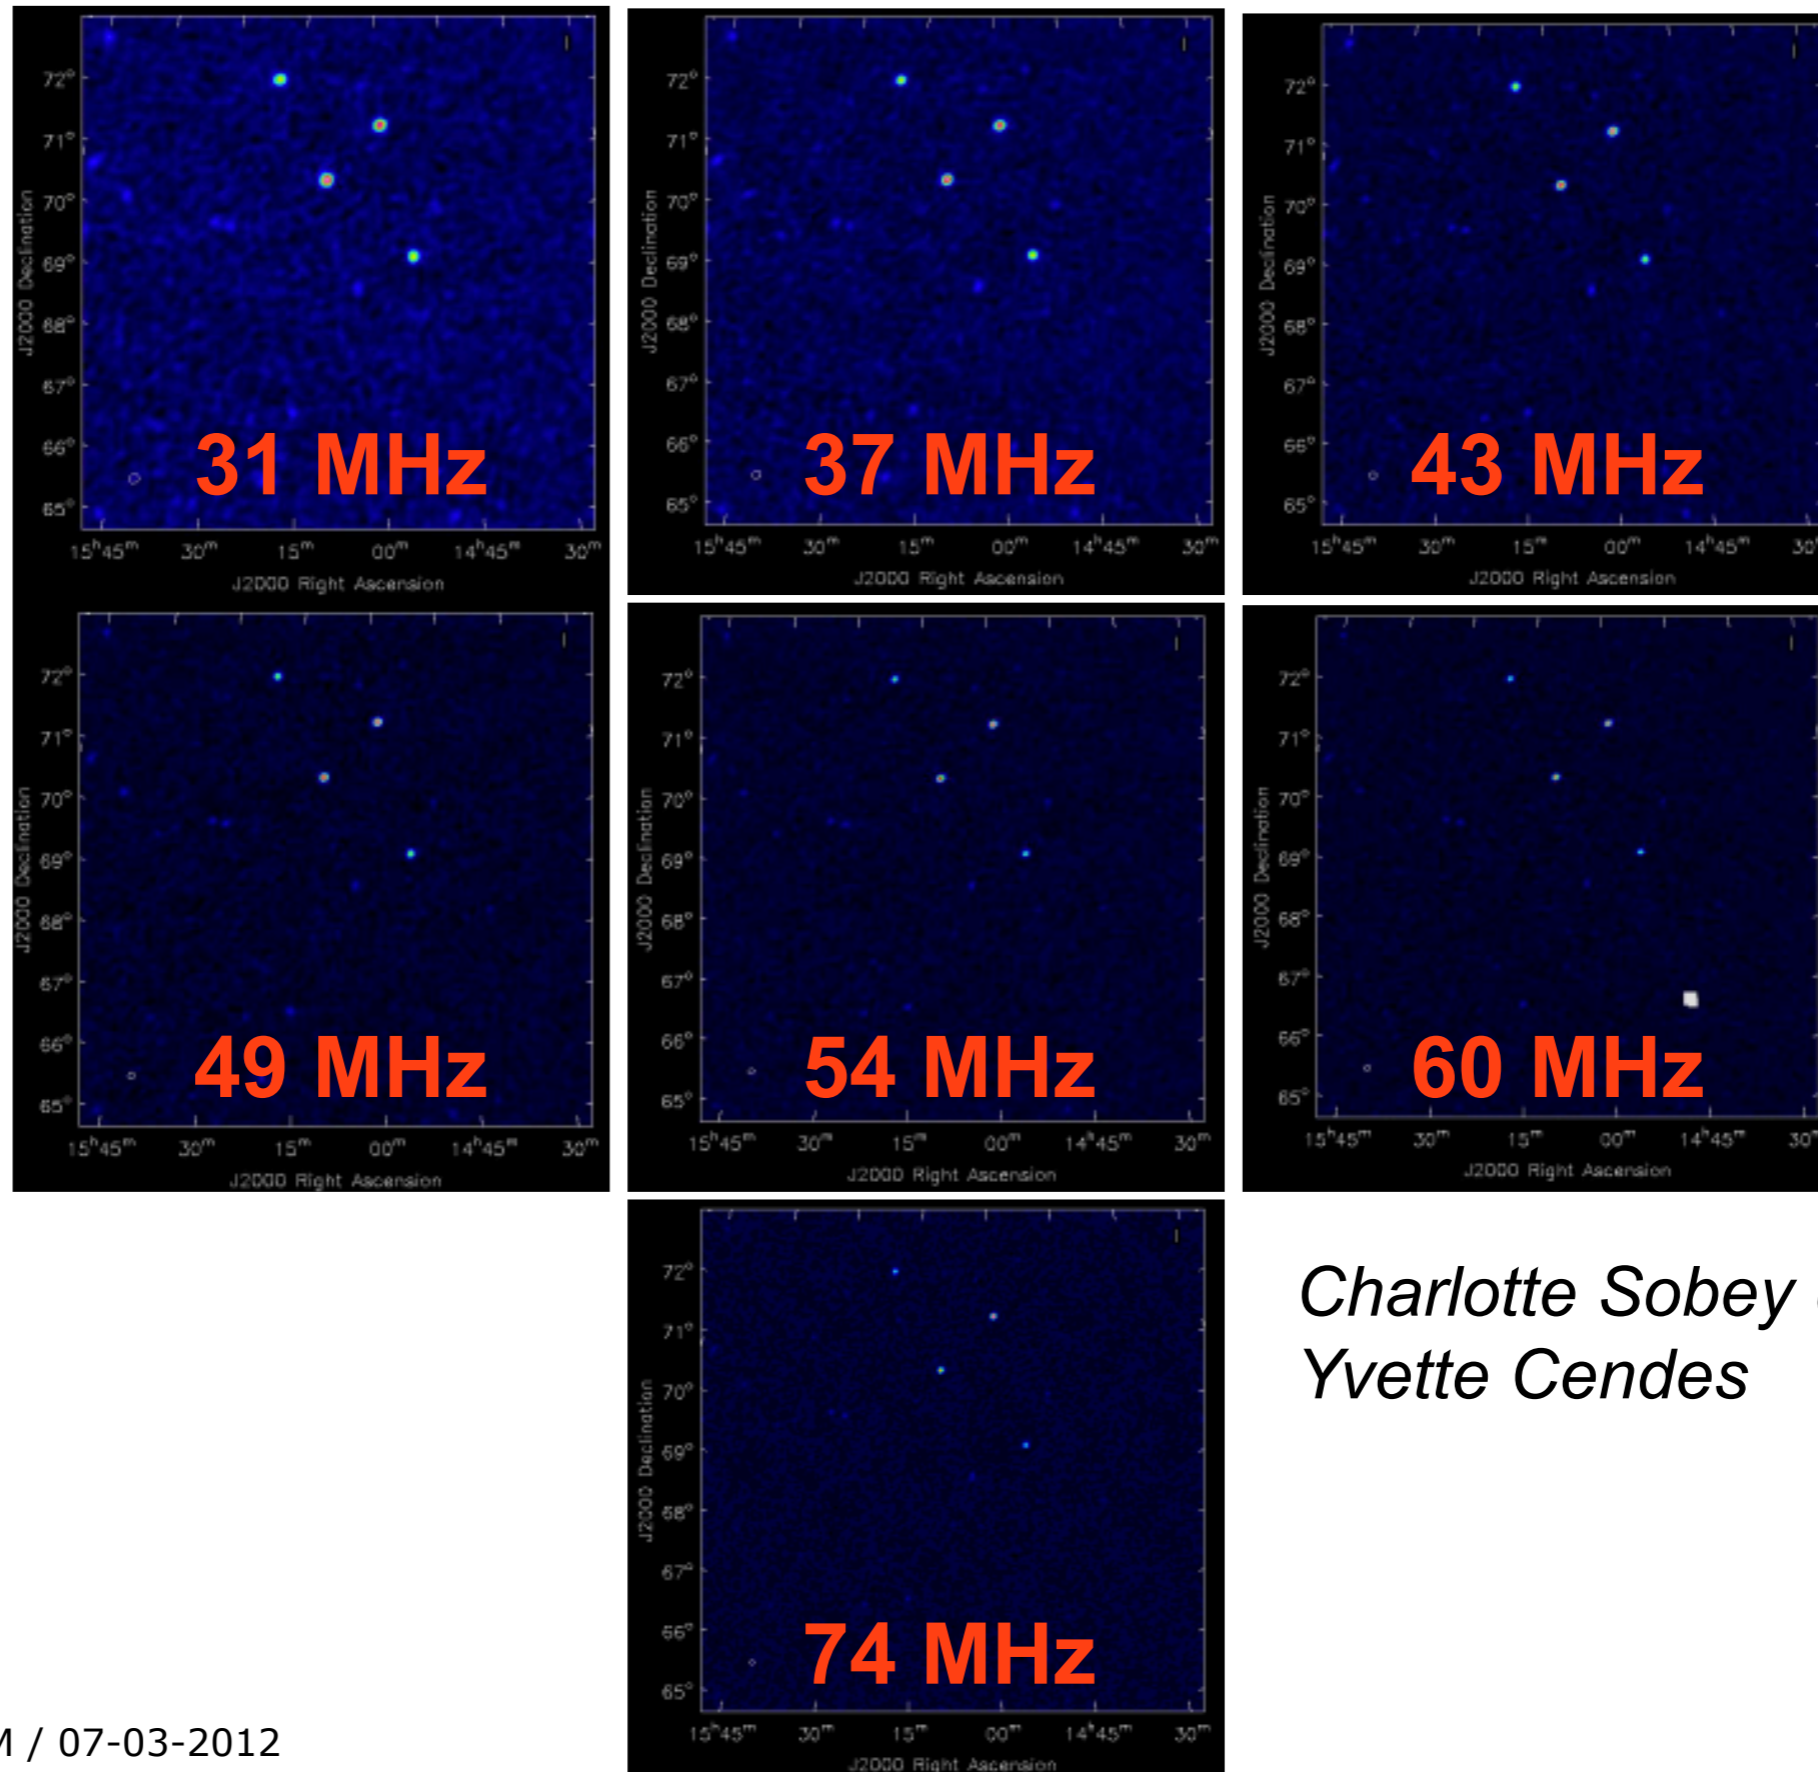

- New scripts auto-identify bad stations (then remove w/ msselect)

- Flagging & demixing (done automatically by calibrator & target pre-processing pipelines)
- collection of data onto work node
- calibration of cal-beam and replacement of outlier amplitudes
- application of gains to target, combination into 2MHz bands
- identification of bad stations and removal
- phase-only calibration against VLSS catalog extraction
 - *NB: TEC tests show unstable solutions during bad snapshots (Peeyush Prasad)*
- combination of time snapshots and imaging

**All done using a sequence
of a few automatic scripts**

II. Image production

*Charlotte Sobey &
Yvette Cendes*

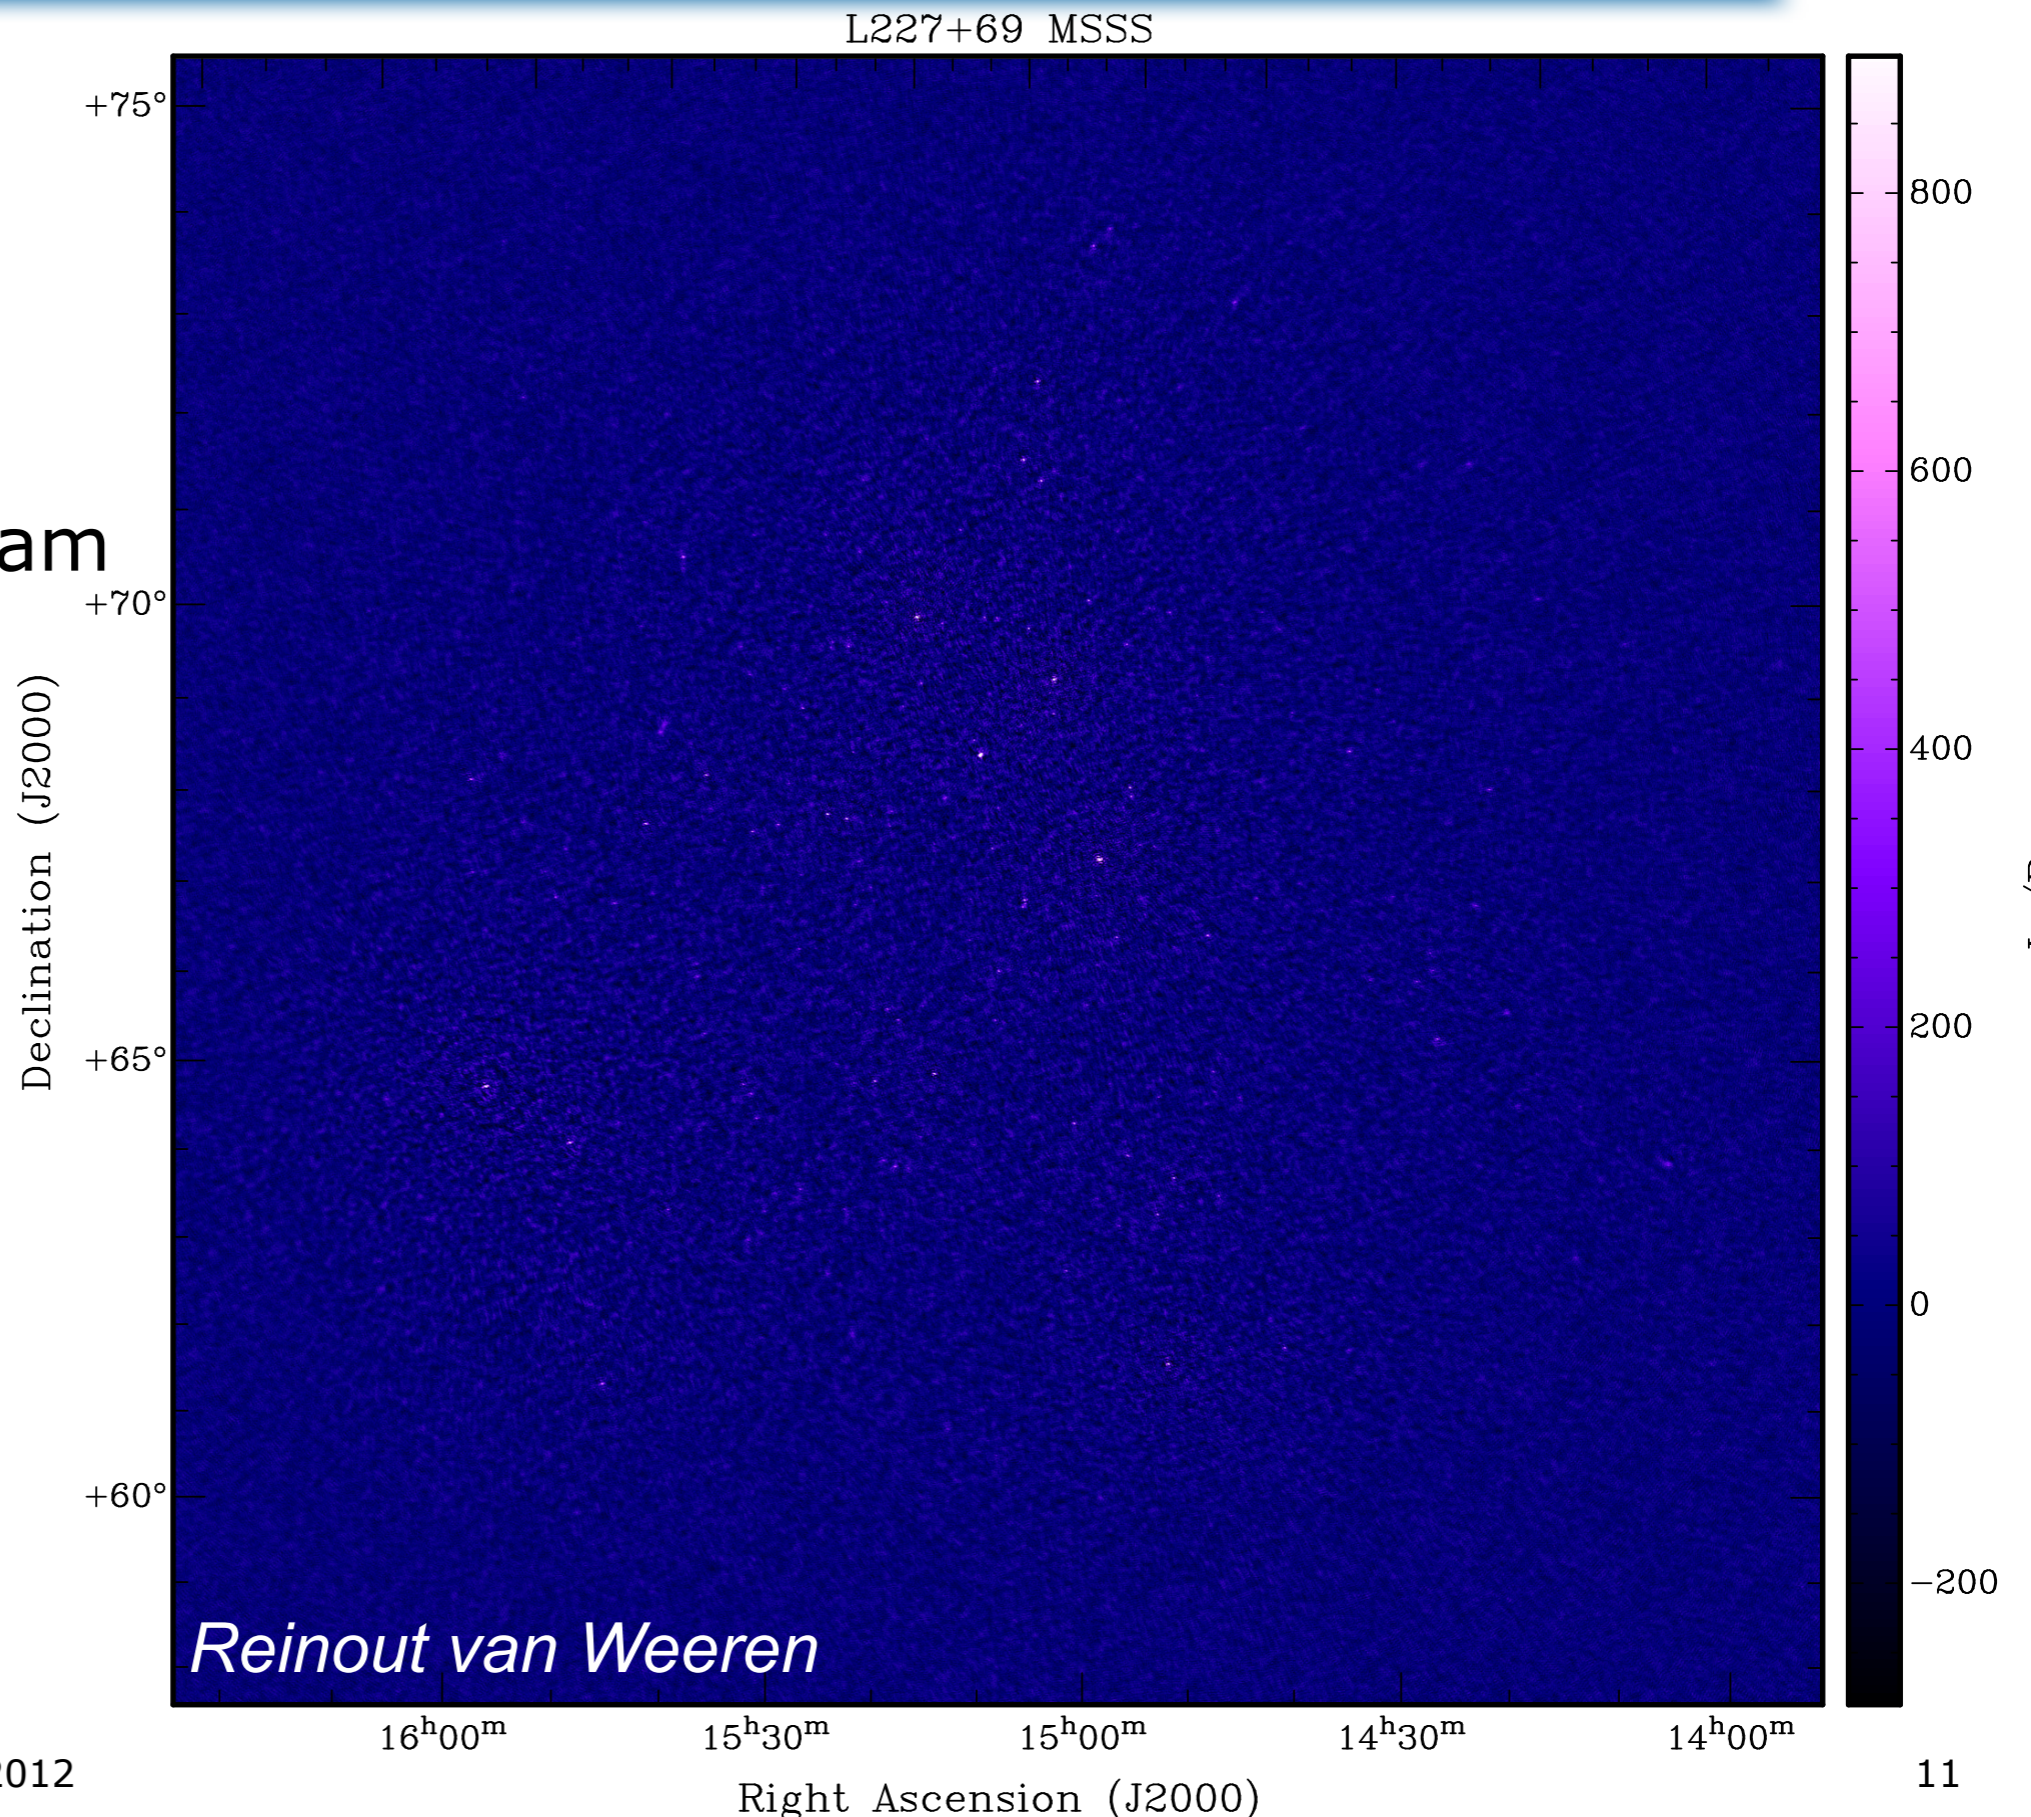

II. Image production

- 3C196 field
- Note no selfcal
- Image noise ~ 100 mJy/beam
- 3C196 is ~ 150 Jy
- Artifacts from bright field sources...
- Beamsize $\sim 53'' \times 24''$
(but it was a long awimager job...)

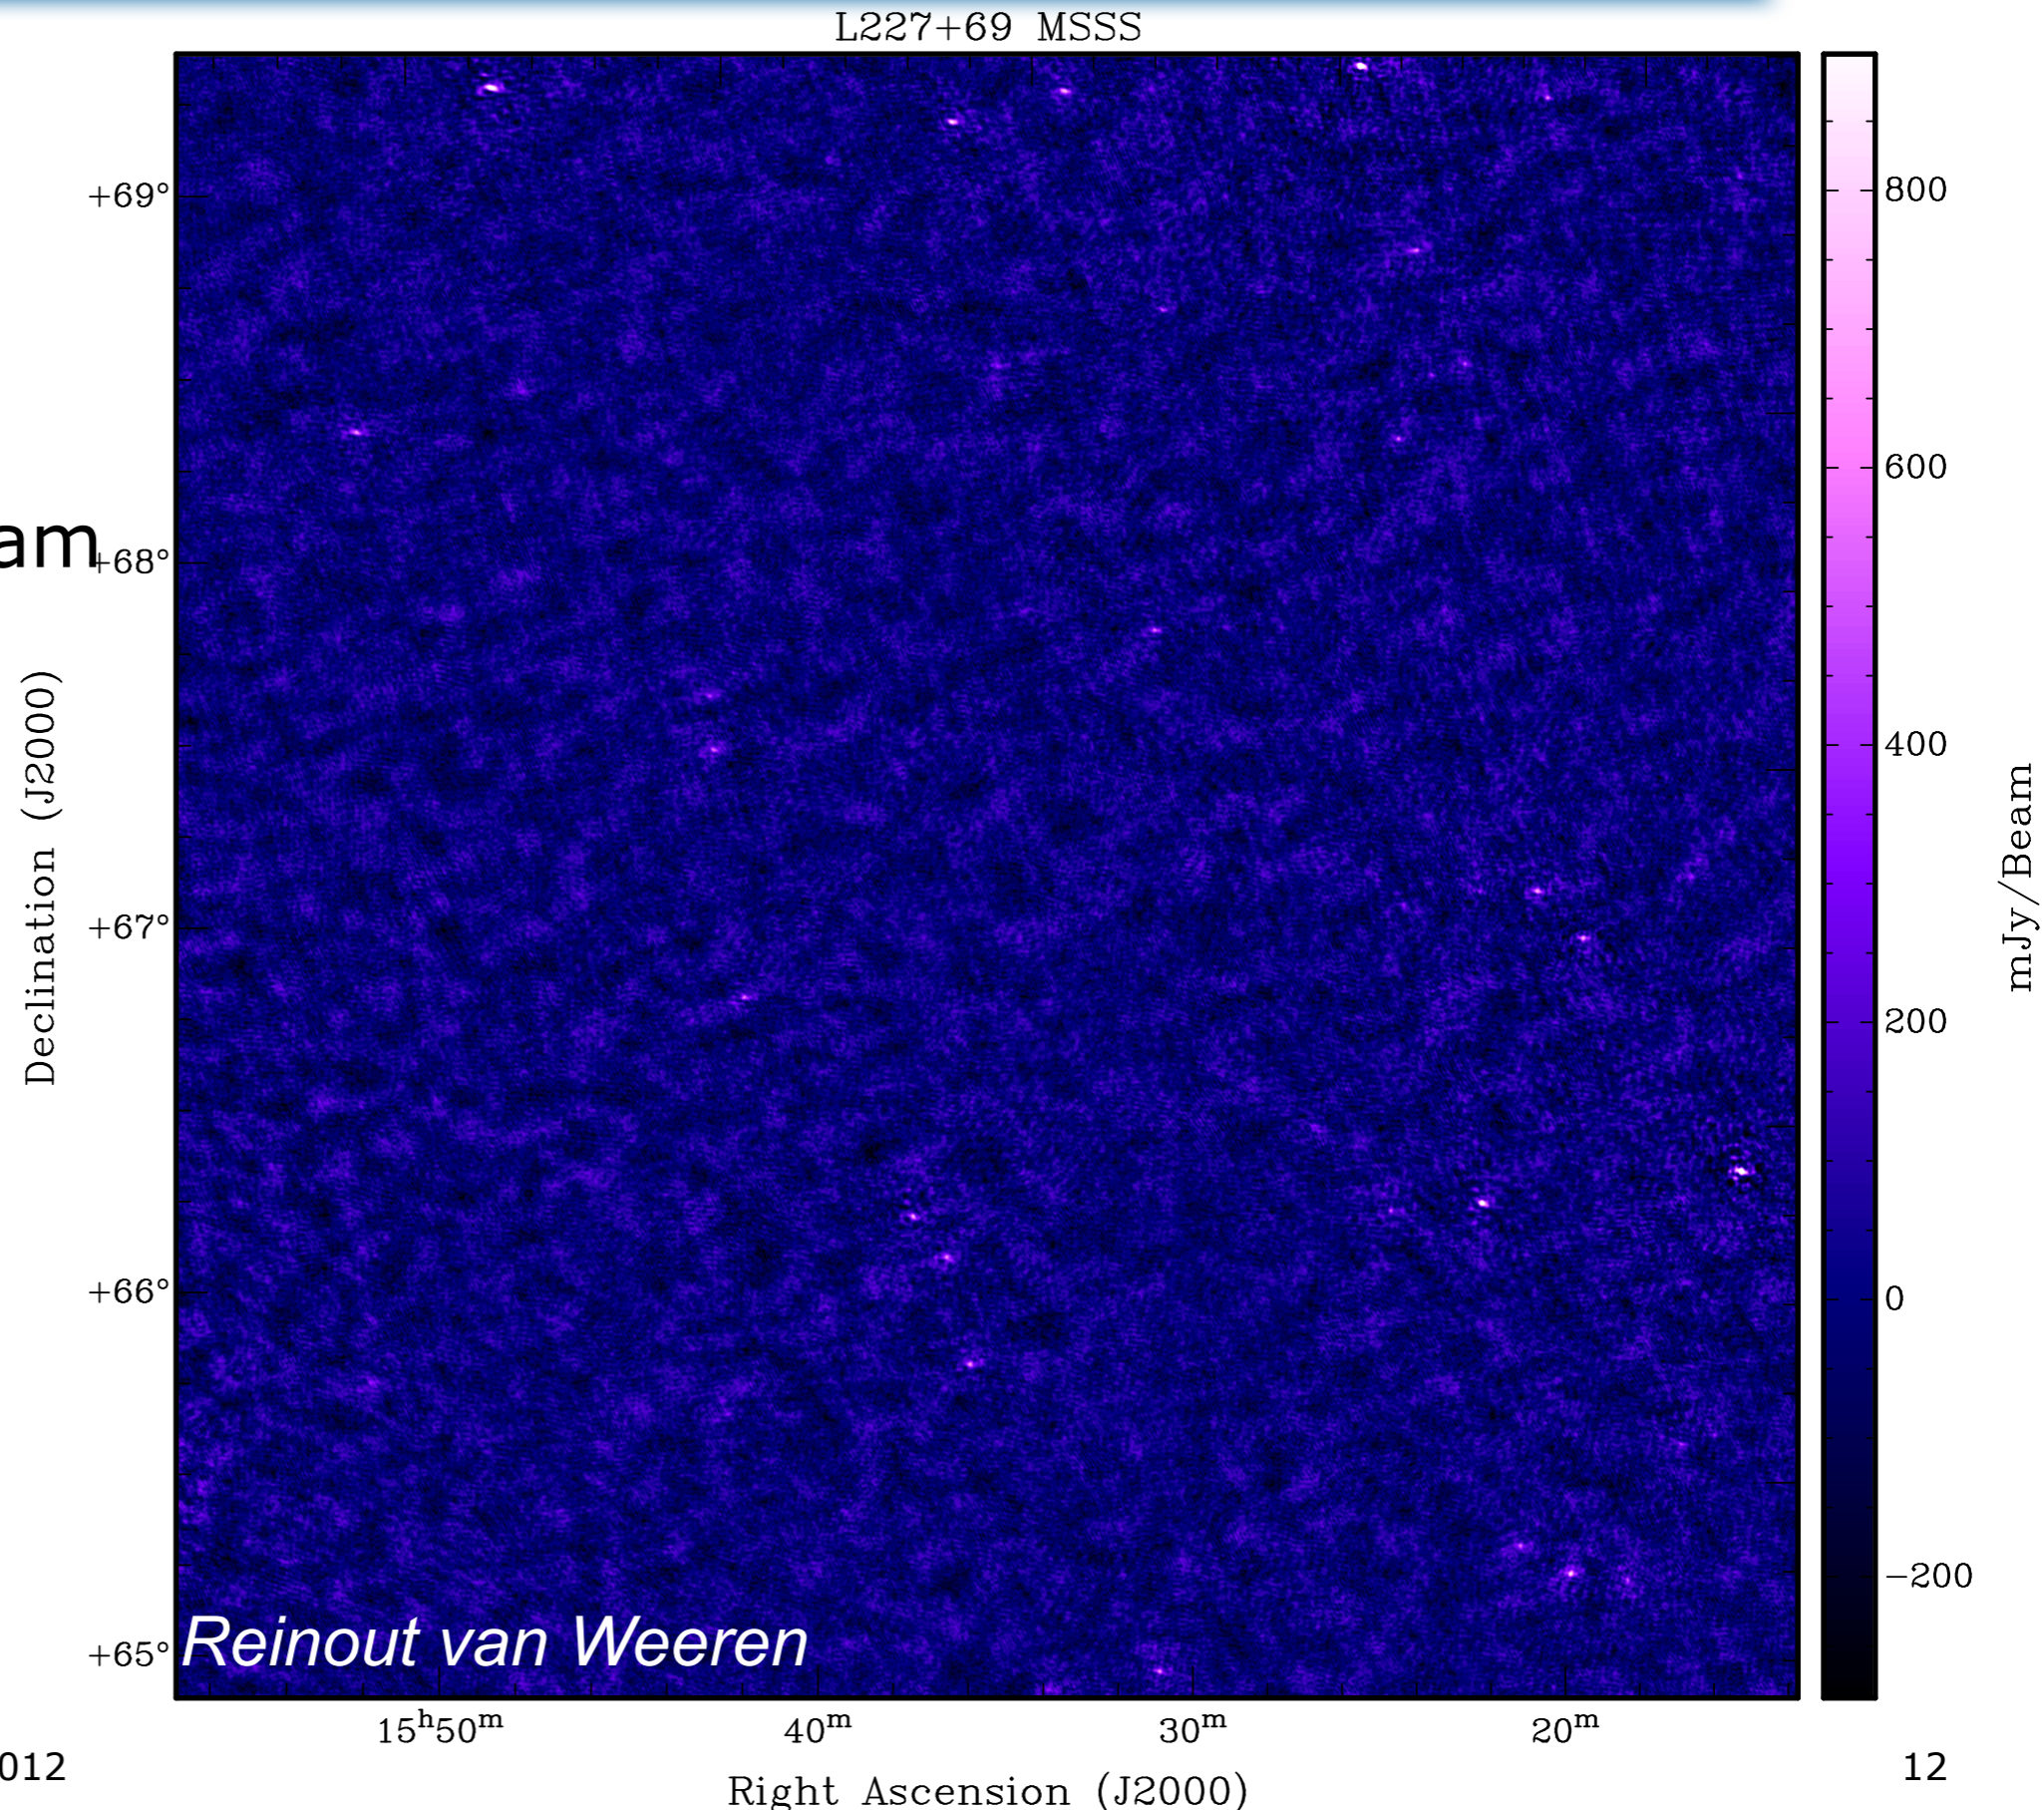

II. Image production

- HUGE image (7200^2 pixels)
- Noise level 50-80 mJy/beam
- Beamsize $\sim 43'' \times 38''$
- 68 MHz
- ~ 200 sources detected
- Still no selfcal

II. Image production

- HUGE image (7200^2 pixels)
- Noise level 50-80 mJy/beam
- Beamsize $\sim 43'' \times 38''$
- 68 MHz
- ~ 200 sources detected
- Still no selfcal

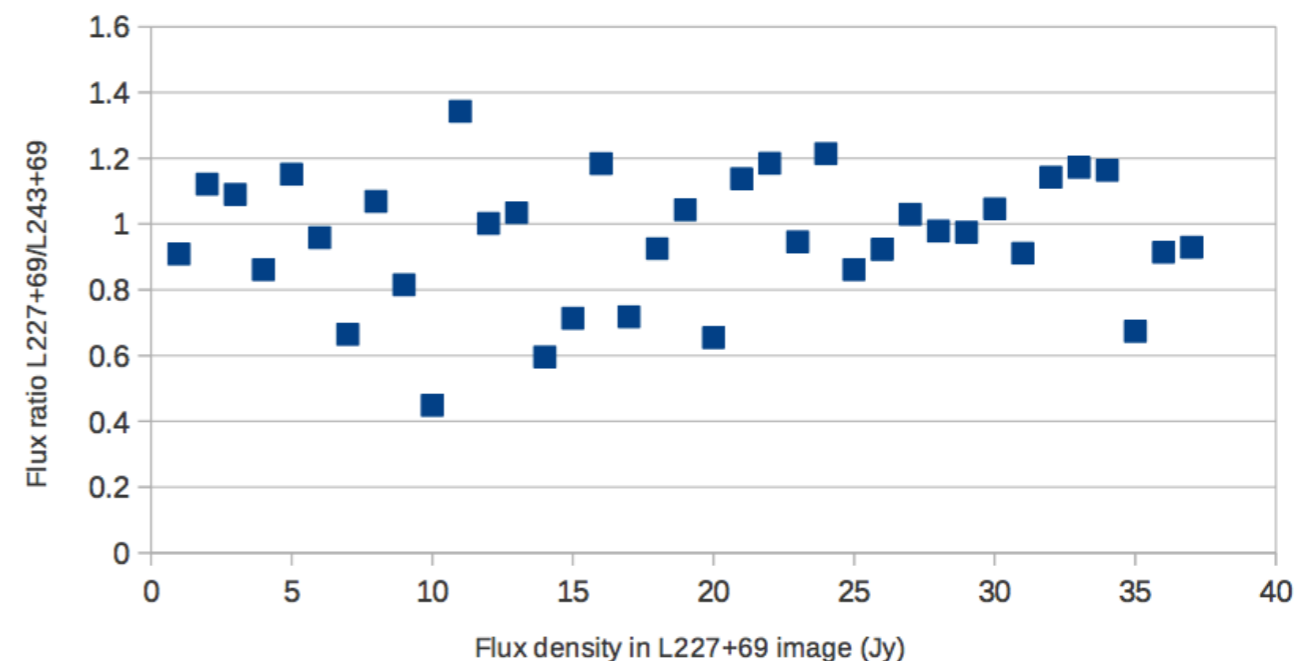

- Overlapping fields L243+69 and L227+69

Source fluxes between fields agree on average; large scatter may be due to beam errors and lack of selfcal step

Jess Broderick & Gosia Pietka

- Comparison L227+69 and L243+69 (BAND5=60 MHz) with VLSS
- Average spectral index would be ~ -1.6 (MSSS fluxes too high)

- Subtle BBS-parset error discovered at the end of last week: element beam correction was being applied to the data *twice*
 - This may be the cause of the offset; investigation ongoing this week to confirm or discount this possibility

- MSSS images can be produced with reasonable processing
- Still without selfcal, but VLSS-like (x8 simultaneous bands!)
- Lots left to do....
