

update from the
CALIBRATION AND IMAGING
TIGER TEAM 2

LSM 20 January 2016

*Emanuela Orrù, Tammo Jan Dijkema, Jess Broderick, Bas van der Tol,
Stefan Fröhlich, David Rafferty, Andreas Horneffer, Tim Shimwell + others*

Duration: October 2015 – September 2017

Work streams:

- Factor / HBA calibration
- LBA calibration
- AWImager

+ maintenance of DPPP / BBS / AWImager / PyBDSSM

- October 2015: Start of project
- 9 – 11 December 2015: Factor Busy Week 23
- 25 – 29 January 2016: Surveys Workshop on Facet Calibration
- 22 – 25 February 2016: Factor Busy Week 24
- 29 Feb – 4 March 2015: LBA expert workshop at Leiden
- Mid 2016: Workshop “Factor for dummies”

DPPP + AWImager developments

- DPPP predict can now (release 2.15, Jan 25 2016) be used for subtracting sources

```
steps=[predict]
predict.operation      = subtract
predict.sourcedb      = 3C196.sourcedb
predict.applycal.parmdb = instrument      # corrupt the sources
```

- Smart Demix commissioned, works (to be adopted by RO)
- Issue resolved in AWImager2 which caused it to write only zeros.
To use AWImager2:

```
source /opt/cep/tools/citt/lofarinit.sh
```
- Image Domain Gridding being tested on GPUs by Dome group

Factor Busy Week 23

Participants:

CITT + Sarrvesh, George Heald, David Mulcahy, Josh Albert, Soomyajit Mandal, Alexander Drabent, Duy Hoang, Edwin Retana Montenegro

Main goal:

Testing Factor (automated facet calibration) on many fields

Results:

- issue found that made awimager2 + IDG slow in some cases (solved)
- prefactor is now stable
- initsubtract is ok now
- first few facets work ok
- version for interleaved observations to be tested in Busy Week 24

Oversimplified version of Factor

Very much oversimplified, see all previous talks, and documentation:

www.astron.nl/citt/facet-doc

Prefactor

Calibration:

- Flux calibration
- Clock / TEC
- Flagging soln's
- Diagnostic plots

Initial subtract

Image at high resolution
Subtract high resolution model
Image at low resolution
Subtract low resolution model
Merge low- and high-res models

Prepare facets

Find calibrators,
make tessellation

Selfcal per facet

Add calibrators to facet, do selfcal on full bandwidth with heavy averaging

- 2x phase only
- 2x amp+phase

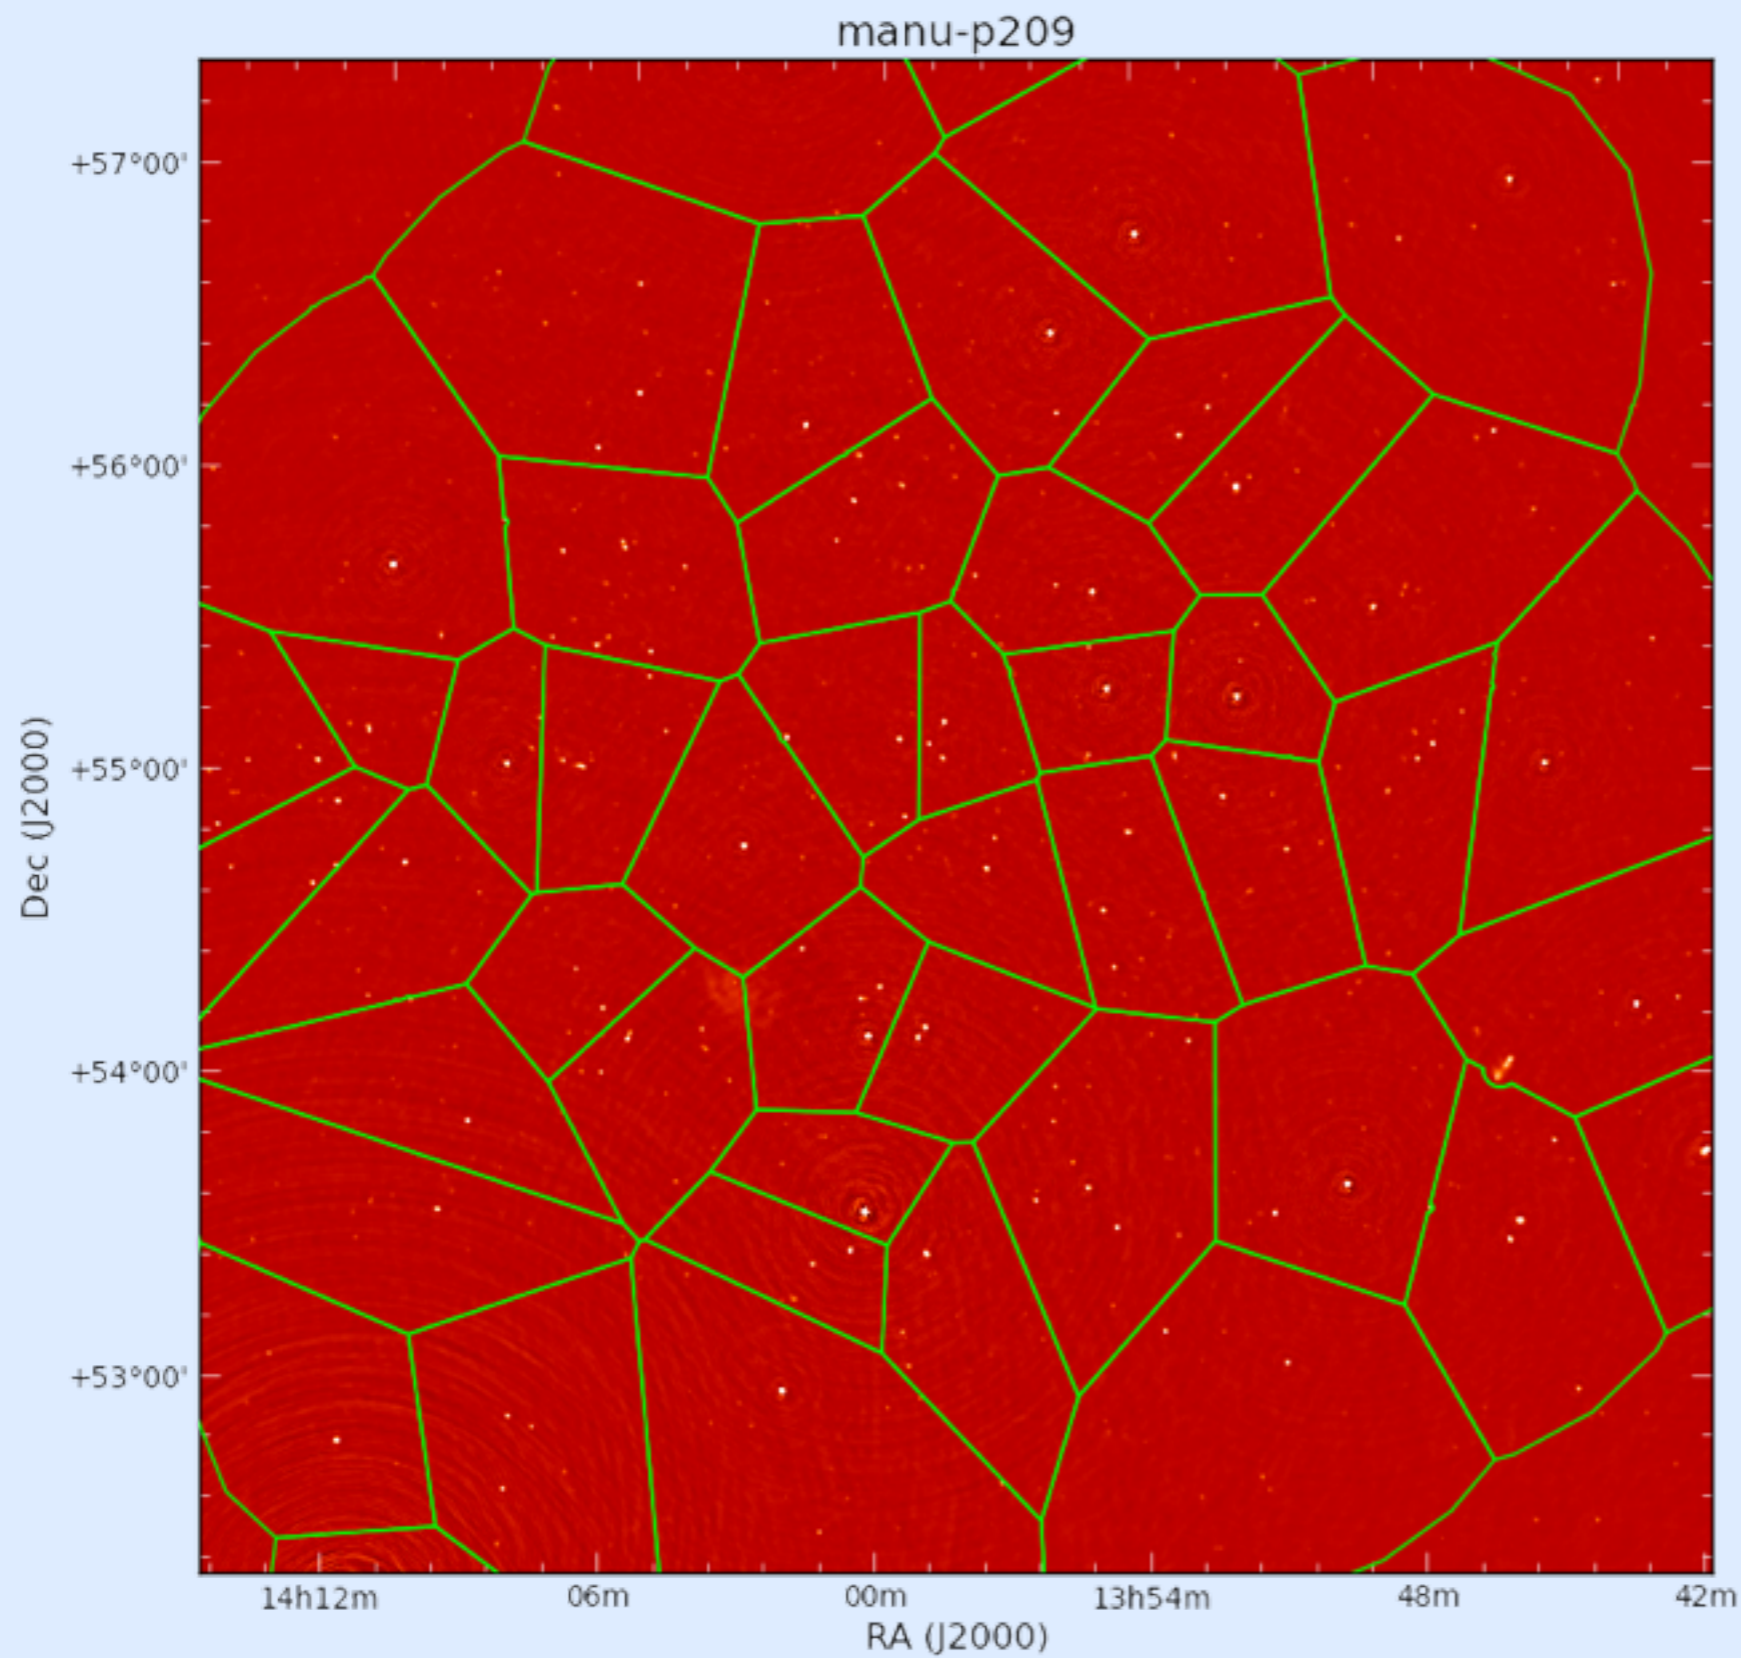

Add all facet sources

Image at high resolution (1.5")

Subtract facet sources

Mosaic

Facet selfcal (David Rafferty)

- Fully automated run of Factor on NEP field (228 subbands)
- Typical noise level $\sim 200 \mu\text{Jy}/\text{beam}$

Monitoring Factor Processing

Tool by David Rafferty
