LOFAR Cosmic Ray Comissioning

Andreas Horneffers
view of the LOFAR-CR Effort

LOFAR-CR Observation Modes

- measure radio pulses from air showers together with an existing air shower experiment:
 - LOPES: together with KASCADE-Grande
 - Radio@Auger: with the Pierre-Auger-Observatory
- LOPES: experiment is running, some data analysis remains
- Auger: mostly hardware development for autonomous antennas

LOFAR

VHECR

Radboud
University
Nijmegen

- **Very High Energy Cosmic Rays**
- measure air showers in by triggering on single dipoles
 - frequency range: 10-88 MHz
 - triggering in several stages
- main goals:
 - study single air showers in great detail
 - measure the transition from galactic to extragalactic CRs

LOFAR

HECR

Radboud
University
Nijmegen

- **H**igh **E**nergy **C**osmic **R**ays
- measure air showers in by triggering beam-formed data
 - frequency range: 10-88 MHz
 - triggering on station beams at CEP
- main goal:
 - extend measured spectrum to lower energies

LOFAR

UHEP

Radboud
University
Nijmegen

- **Ultra High Energy Particles**
- observe radio flashes from the moon
 - frequency range: 115-190 MHz
 - form several tied-array beams on the moon and trigger on the beam-formed data stream
- main goal: observe for the first time particles $> 10^{21}$ eV

LOFAR

OSASS

Radboud
University
Nijmegen

- **One Second All Sky Survey**
- **General TBB-imaging**
 - Includes imaging of lightning
- **Search for transients on time-scales $\ll 1$ sec**
 - frequency-range: ? (same as surveys?)

Commissioning (aka ToDo-List)

Radboud
University
Nijmegen

1. Technical issues
2. Commissioning-data

LOFAR

Technical Commissioning

Radboud
University
Nijmegen

- TBB read-out
- MAC/SAS integration
 - Control of TBBs
 - Trigger interface
- Metadata interface
- General TBB imaging
 - Imaging of **large** datasets
- VHECR trigger
 - TBB trigger
 - LCU trigger-frame
 - CEP trigger-frame
- UHEP/HECR trigger
 - CEP-latency (TBB buffer size!!!)
 - Moon tracking
 - Ionosphere de-dispersion
 - PPF inversion implementation

LOFAR Commissioning Data

Radboud
University
Nijmegen

■ VHECR

- Figure out the correct parameters for the trigger
 - Survey of single-dipole pulse parameters
 - Piggy-backed(?) runs of ~1day with one channel
 - Iterative LCU trigger-algorithm development
 - Piggy-backed(?) runs of ~1day with the superterp
 - Run together with the particle array
- Correct parameters for the offline pipeline
 - Tune the reconstruction algorithm
 - Parameters for event-selection
 - Piggy-backed runs

■ UHEP

- Study noise level and effect of PPF/PPF-inversion
- Iterative trigger-algorithm development
 - “short measurements” (~15min)

- for VHECR mode
 1. TBB stage
 - essentially done, need final testing
 2. LCU stage
 - first version done, needs testing and refinement
 3. CEP stage
- for UHEP/HECR mode
 1. de-dispersion (only UHEP)
 - hope we can borrow this from other KSPs
 2. PPF inversion
 - algorithm defined, needs implementation on Blue Gene
 3. peak finding
 4. UHEP peak evaluation
 5. HECR peak evaluation
- Particle array
 - general design and layout planned
 - need to build and test detectors

LOFAR

CR-KSP Tasks

Radboud
University
Nijmegen

- tasks are grouped into four tasks:
 1. Triggering
 - “Algorithms to decide when to dump the TBB data”
 2. Software
 - implement analysis software
 - batch and interactive mode
 - have to write basically everything on our own
 3. Simulations
 - lots of work done by loosely associated people
 4. Data analysis
