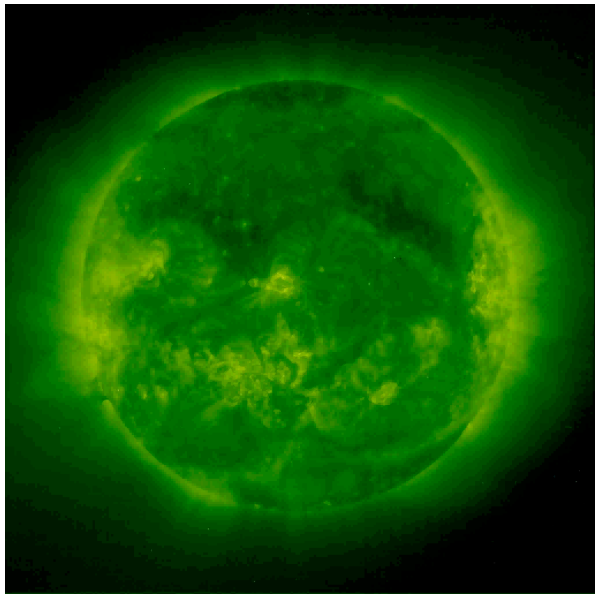
An der Sternwarte 16, D-14482 Potsdam, Germany
GMann@aip.de

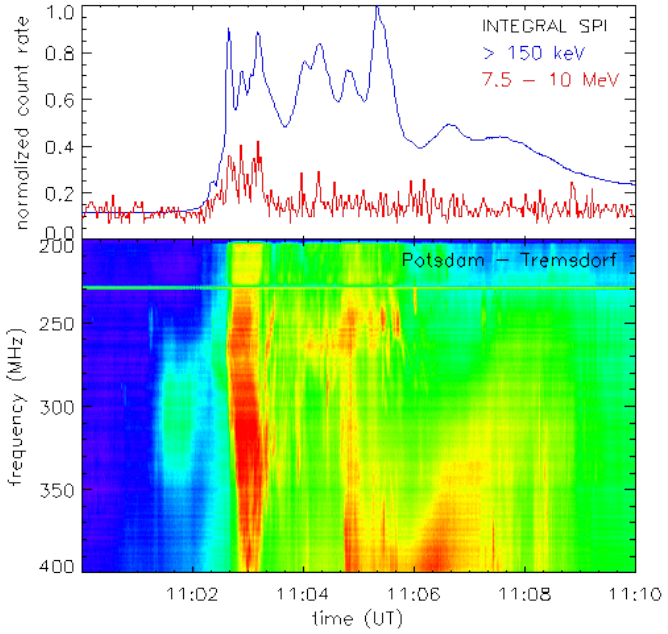
The Sun is a radio emitter.

nonthermal solar radio radiation

– sensitive indicator of ***solar activity***



solar event on Oct. 28, 2003



Leibniz Gemeinschaft

Bundesministerium für Bildung und Forschung

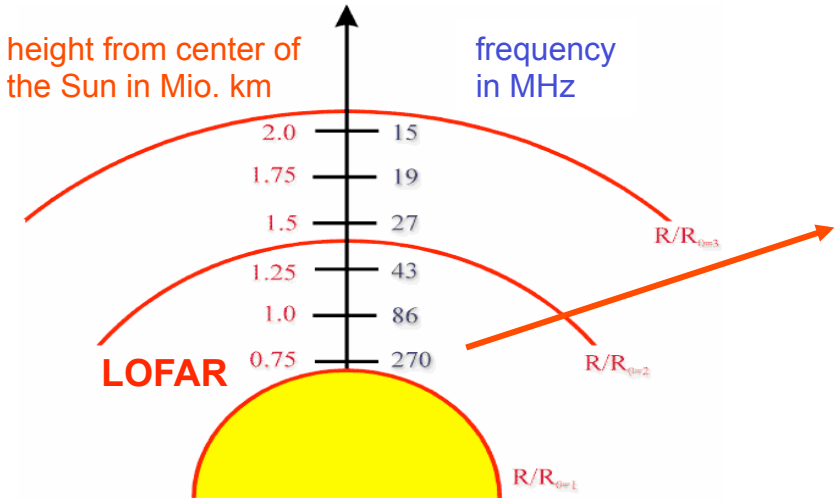
Coronal Density Model

f	r/R_S
240	1.17
200	1.21
170	1.24
150	1.27
100	1.37
70	1.48
40	1.68
30	1.80

radio wave emission → plasma emission

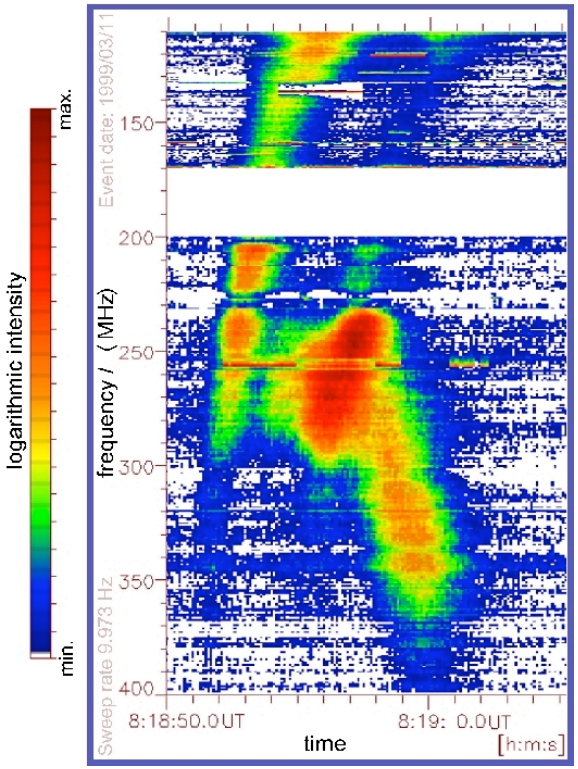
$$f \approx \sqrt{e^2 N_e / \pi m_e}$$

heliospheric density model (*Mann et al., 1999*)



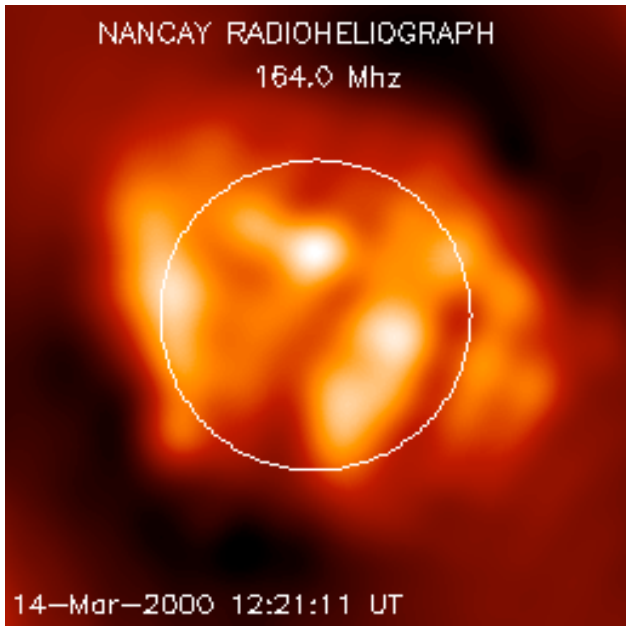
height ≙ frequency

velocity ≙ drift rate

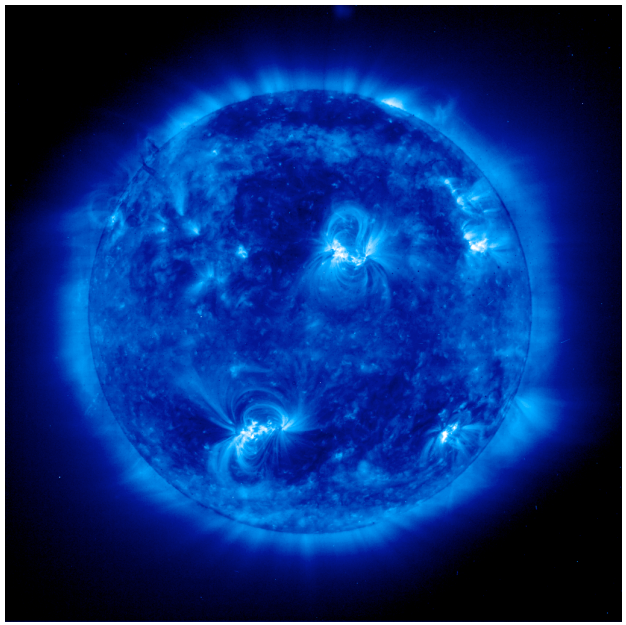


dynamic radio spectrogram ↔ height-time diagram

Solar Observations with LOFAR



Nancay radio heliograph image
(resolution 60“ = 43000 km)



- theoretical resolution 2“
- due to scattering of radio waves in the corona → resolution 40 – 60“

→ **LOFAR‘s core stations are sufficient enough for observing the corona.**

LOFAR will provide radio images of the Sun with a resolution of few 10“.

Observing Modes for the Solar KSP

LOFAR will be able to measure the solar radio radiation in the range 30 – 240 MHz with a heigh spectral and temporal evolution.

The radio images at different frequencies, i.e. different height levels, allows a 3D tomography, of the flare related processes in the corona of the Sun.

3 observing modes:
- radio spectrometery (spectrometer mode)
- solar burst imaging (burst mode)
- monitoring the solar activity (monitoring mode)

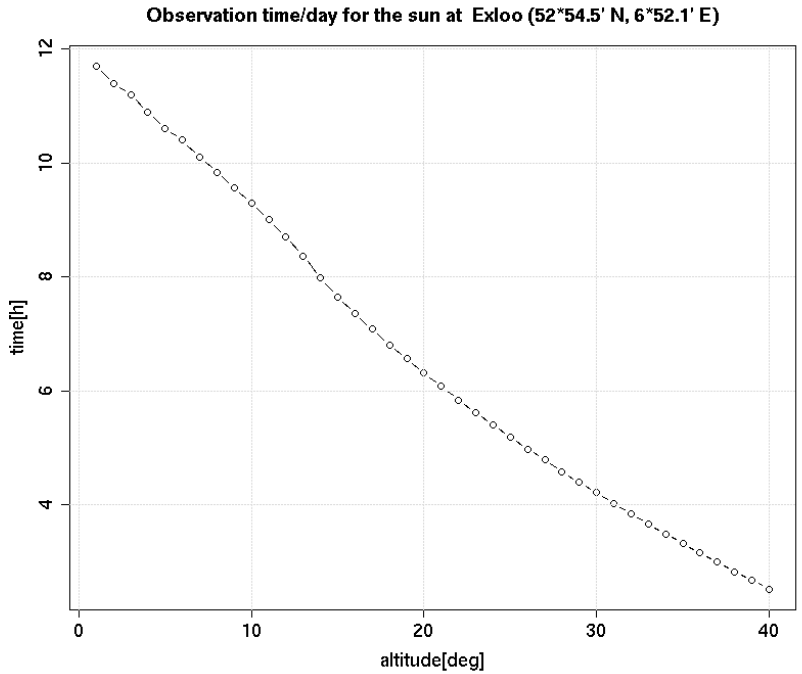
– ***Solar Science Data Center*** at the AIP

– complementary ground-based observations to space missions
(e.g. RHESSI, STEREO, Hinode, SDO, and Solar Orbiter (EPT, STIX)) and to LOIS

The monitoring mode provides an important input for the forecast of solar activity.

– ***Space Weather*** is of social relevance → important for our funding agencies.

Observation Time



daily observation time for the Sun
with an altitude > 10°.

in average: 8h

thermal flux of the Sun: ≈ 1 sfu = 10^{-22} W·m^{-2}·Hz^{-1}

non-thermal flux at flares: ≤ 10^4 sfu

Data Volume I

spectrometer mode:

- temporal resolution 0.01 s
- spectral resolution 100 kHz

  30 – 80 MHz and 120 – 240 MHz (= 170 MHz total band with)
  → 170 MHz/100 kHz = 1700 channels

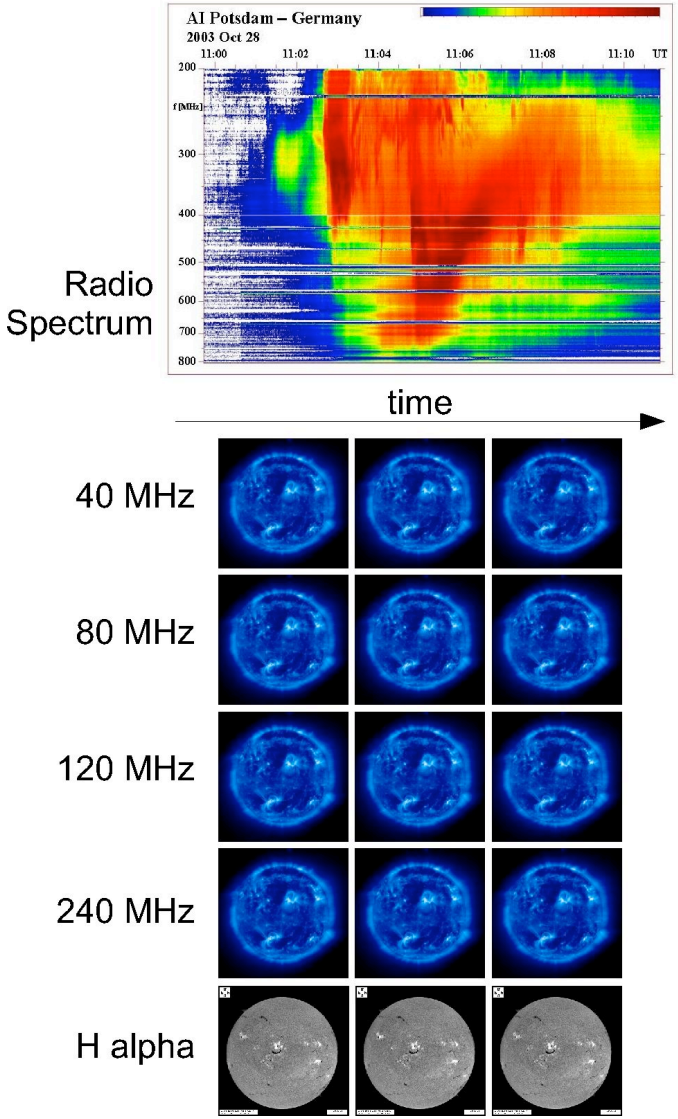
  each value = 2 bytes → data rate: 340 kB/s = 1.224 GB/h

- Multiple stations (8) have to be combined.

monitoring mode:

- temporal resolution 1 minute
- frequencies: 40, 80, 120, 240 MHz → data rate: 26 kB/s = 93.6 MB/h

Monitoring the Solar Activity



link to the H_α-patrol mission

KSO (Kanzelhöhe, Austria)

Data Volume II

burst mode:

– temporal resolution: 0.1 s
– measuring at 22 frequencies

low band:

frequency Nr.	1	2	3	4	5	6	7	8	9
frequency [MHz]	40	45	50	55	60	65	70	75	80

high band:

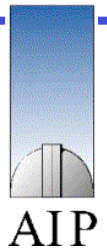
frequency Nr.	10	11	12	13	14	15	16	17	18	19	20	21	22
frequency [MHz]	120	130	140	150	160	170	180	190	200	210	220	230	240

→ data rate: 100 MB/s = 360 GB/s

The switching between monitoring and burst mode can be triggered by an external instrument (egs. radiospectrometer 30 – 2000 MHz), which acts on a ***burst bell.***

Data Volume III

(Summary)



data type	data rate [MB/s]	data per year [TB]
burst mode	100	100
monitoring mode	0.026	0.27
spectrometer mode	0.34	3.57

Let‘s hope to realize our intentions concerning LOFAR

LOFAR Remote Stations in Germany

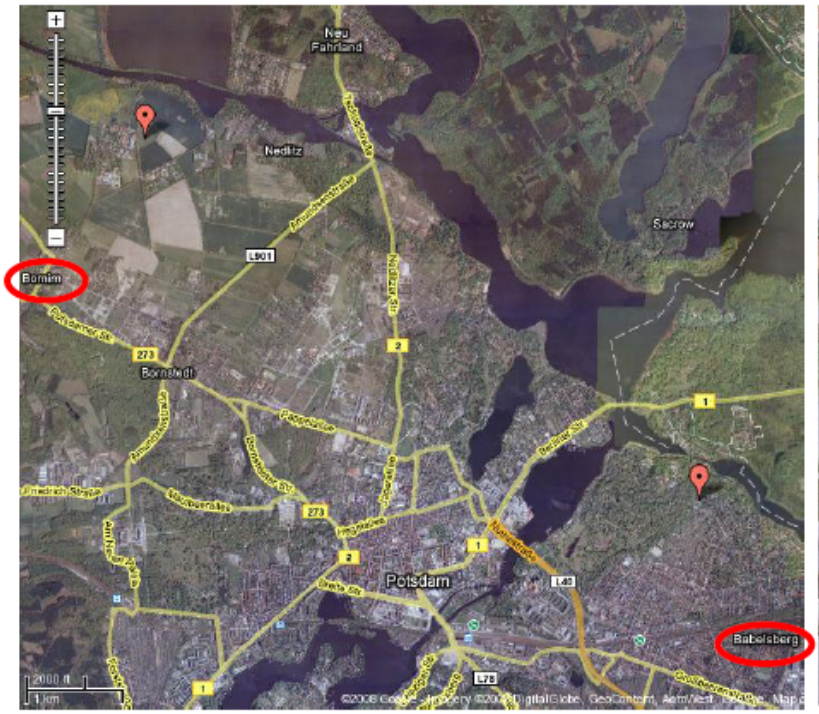
Funded: 5

Planned: + 2

Wanted: + 3

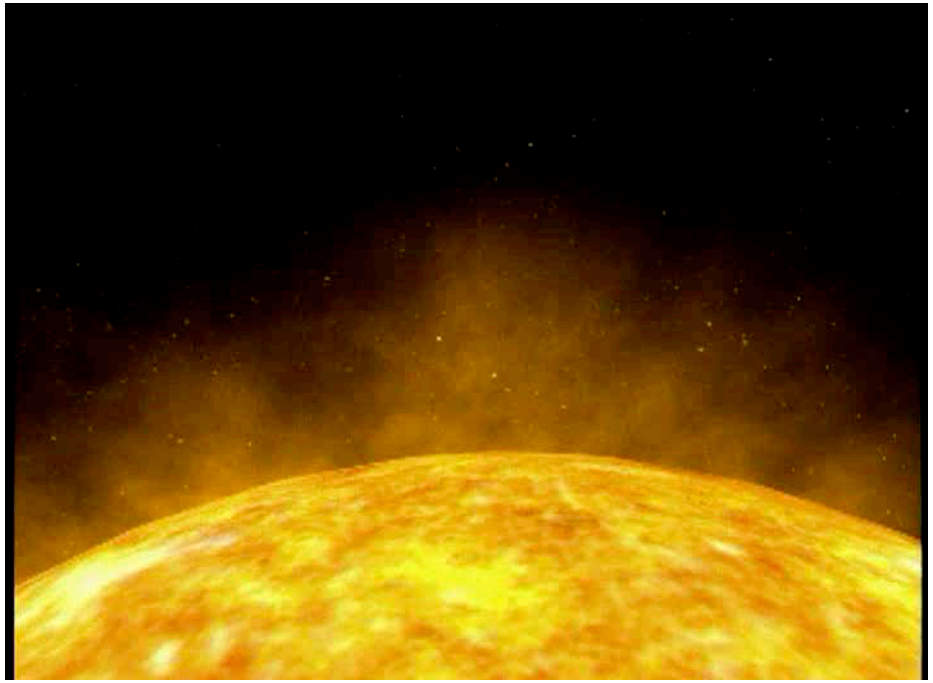
Station of the AIP in Potsdam-Bornim

Site at the Leibniz-Institut für Agrartechnik Potsdam-Bornim (ATB)



Space Weather

The ***Sun*** is influencing our ***Earth's environment***.



- ***solar flares – emission of electromagnetic radiation (radio – γ ray range)***

  → ionosphere
  → upper atmosphere

- ***energetic particles***
  (after 10 – 60 minutes)

  → northern lights
  → disturbances of electronic equipments

- ***Coronal Mass Ejections***
  (after 20 – 100 hours)

  → magnetic storms
  → disturbances of navigation
  → voltage flashes in pipelines
