

Technical Status of LOFAR

André W. Gunst

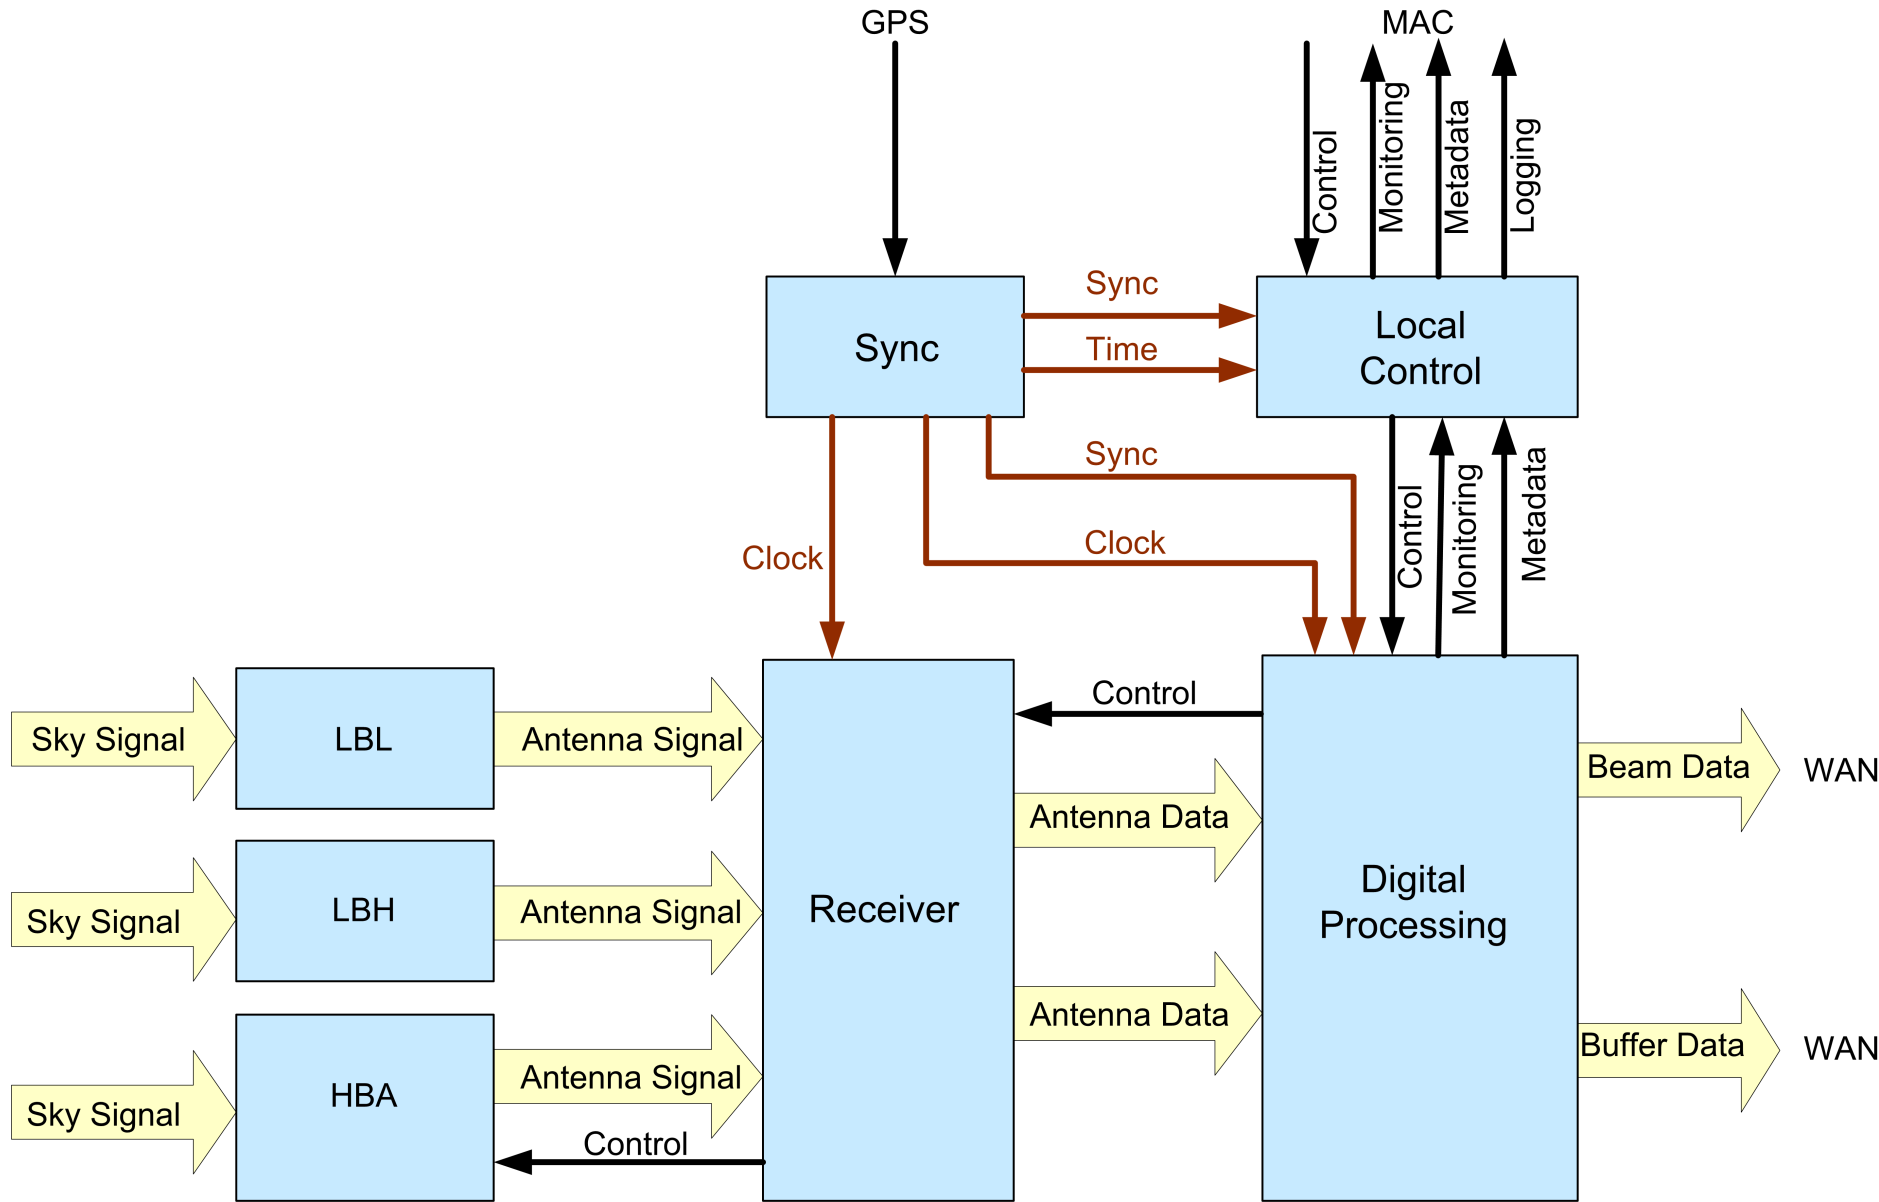

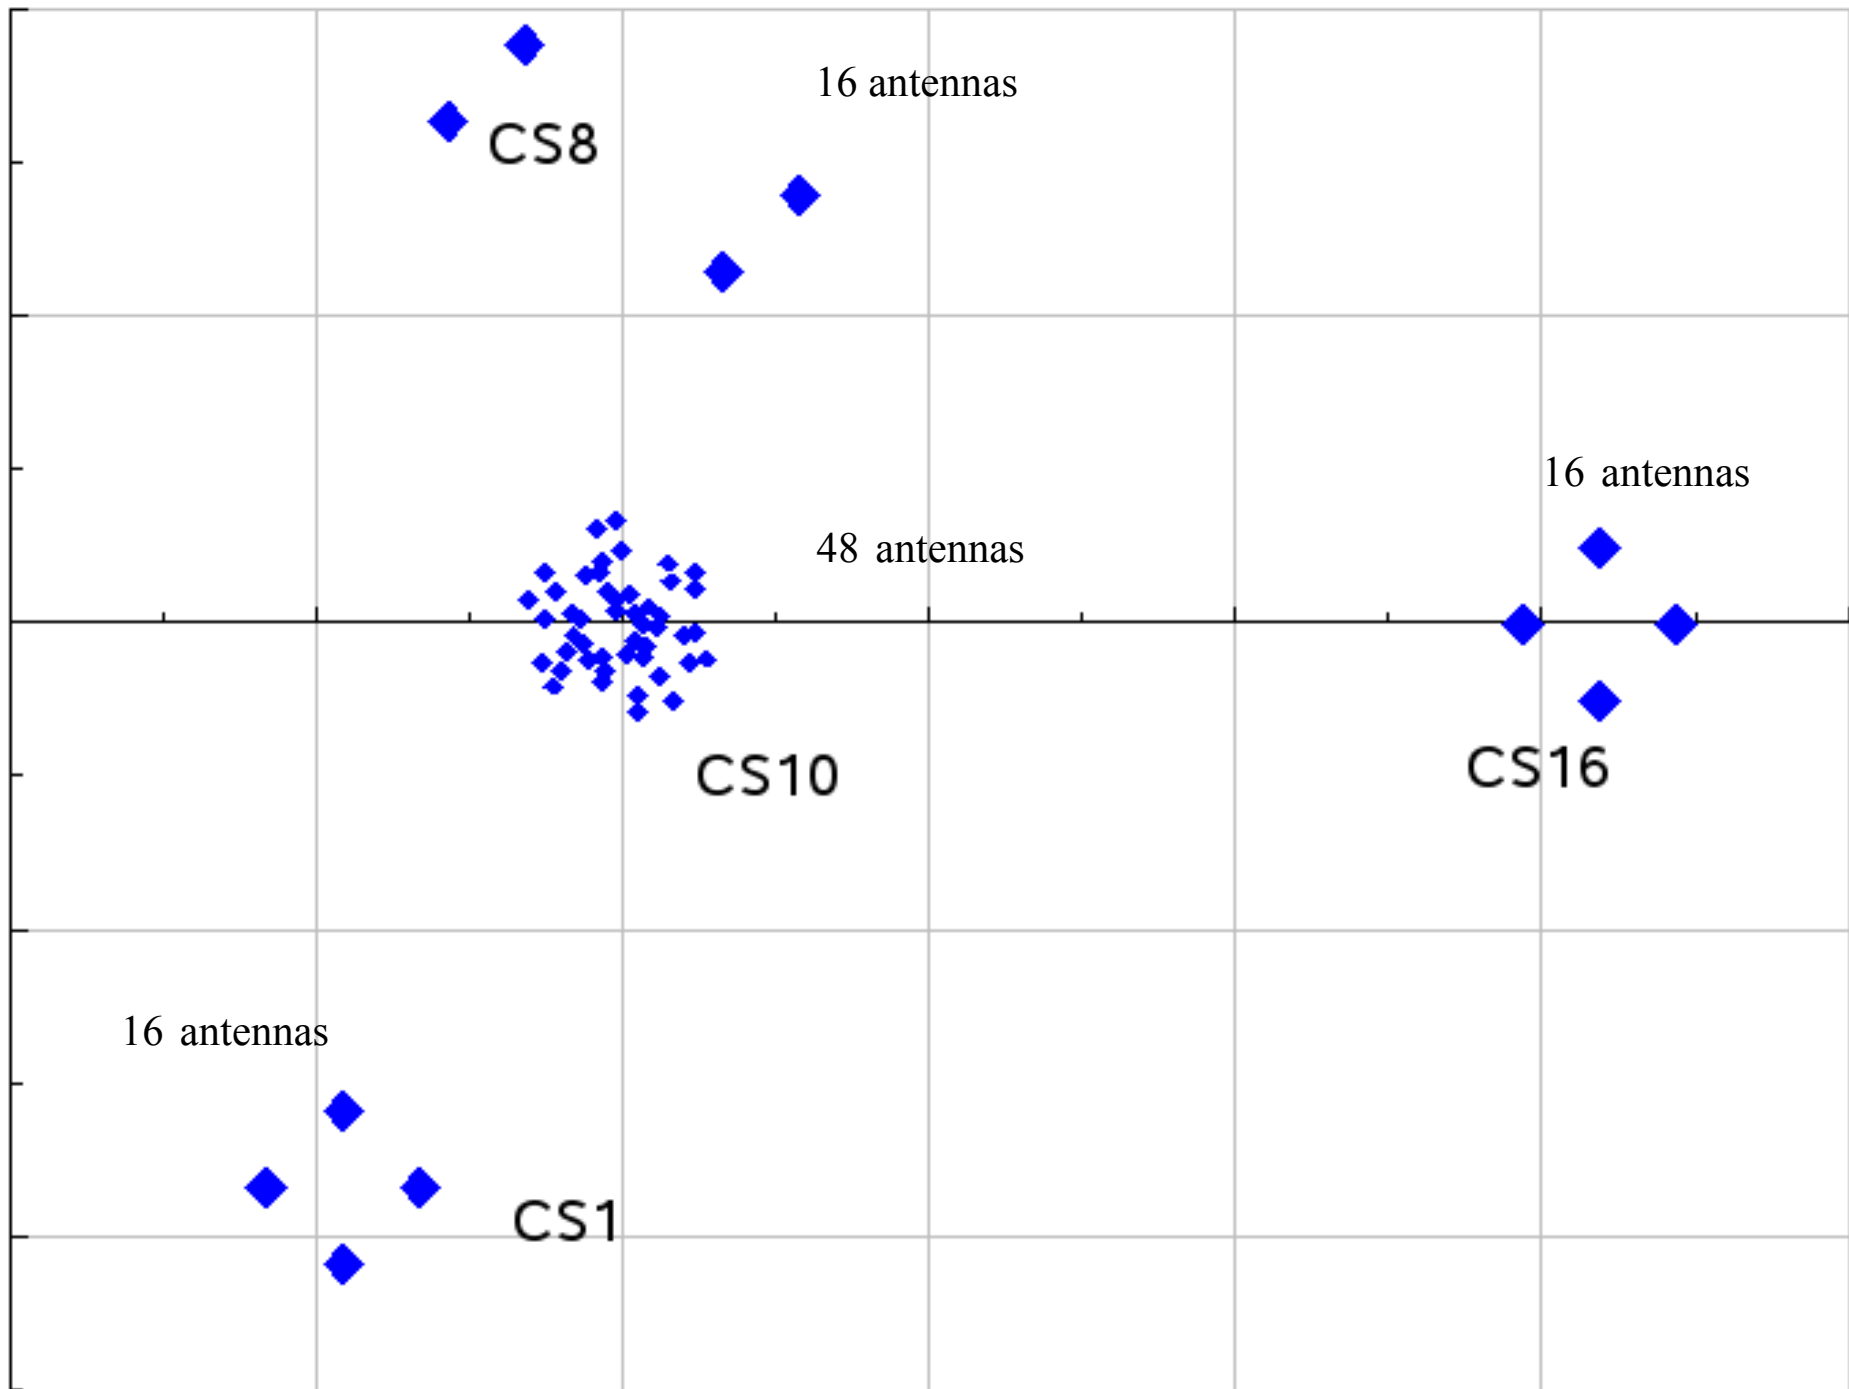

- LOFAR architecture in a nutshell
- What is done
- What is not done yet

Top level architecture

Station architecture

CS1 in the field

CS008

CS010

CS001 CS016

- Pipeline from antenna to calibrated result works and resulted in “cleaned” images

Excluding: HBA, TBB, full calibration, full bandwidth, multiple beams, real core stations, robustness, ...
 Including: bugs and issues

- Each uStation (of 4 per station) can transport maximal:
 - ☞ 49 subbands @ 160 MHz
 - ☞ 39 subbands @ 200 MHz

- This scales up for one station to
 - ☞ 30.63 MHz @ 160 MHz (985 Mbps)
 - ☞ 30.47 MHz @ 200 MHz (990 Mbps)

- To use resources efficiently the current CEP bandwidth for each uStation (of 4) is limited to
 - 48 subbands @ 160 MHz
 - 36 subbands @ 200 MHz

- This scales up for one station to
 - 30.00 MHz @ 160 MHz
 - 28.13 MHz @ 200 MHz

- Number of beams: 1 (goal is 8)
- Number of microstations: 16 (goal is 24)
- All fields equipped with Low Band Antennas

➤ Currently in the field

- Reliability/lifetime problem
 - ➡ Front end units break if the humidity increases
 - ➡ This can be reproduced in the lab
 - ➡
- Power must be optimized (1 W → 237 kW)
- Cost must be reduced (1 Euro → 237 kEuro)

- Currently 25 (new) RSP boards are tested (of 48)
- All interfaces are tested and work

- Four RSP boards are installed at CS001

- In 6.2 version (only installed at CS010) holes in cross correlation matrix are solved
- RSP3 firmware has a bug which cannot be reproduced easily (probably due to improper initialization)
- Remote firmware update of RSP3 in progress

1182842604 - Tue, 26 Jun 2007 07:23:24 +0000

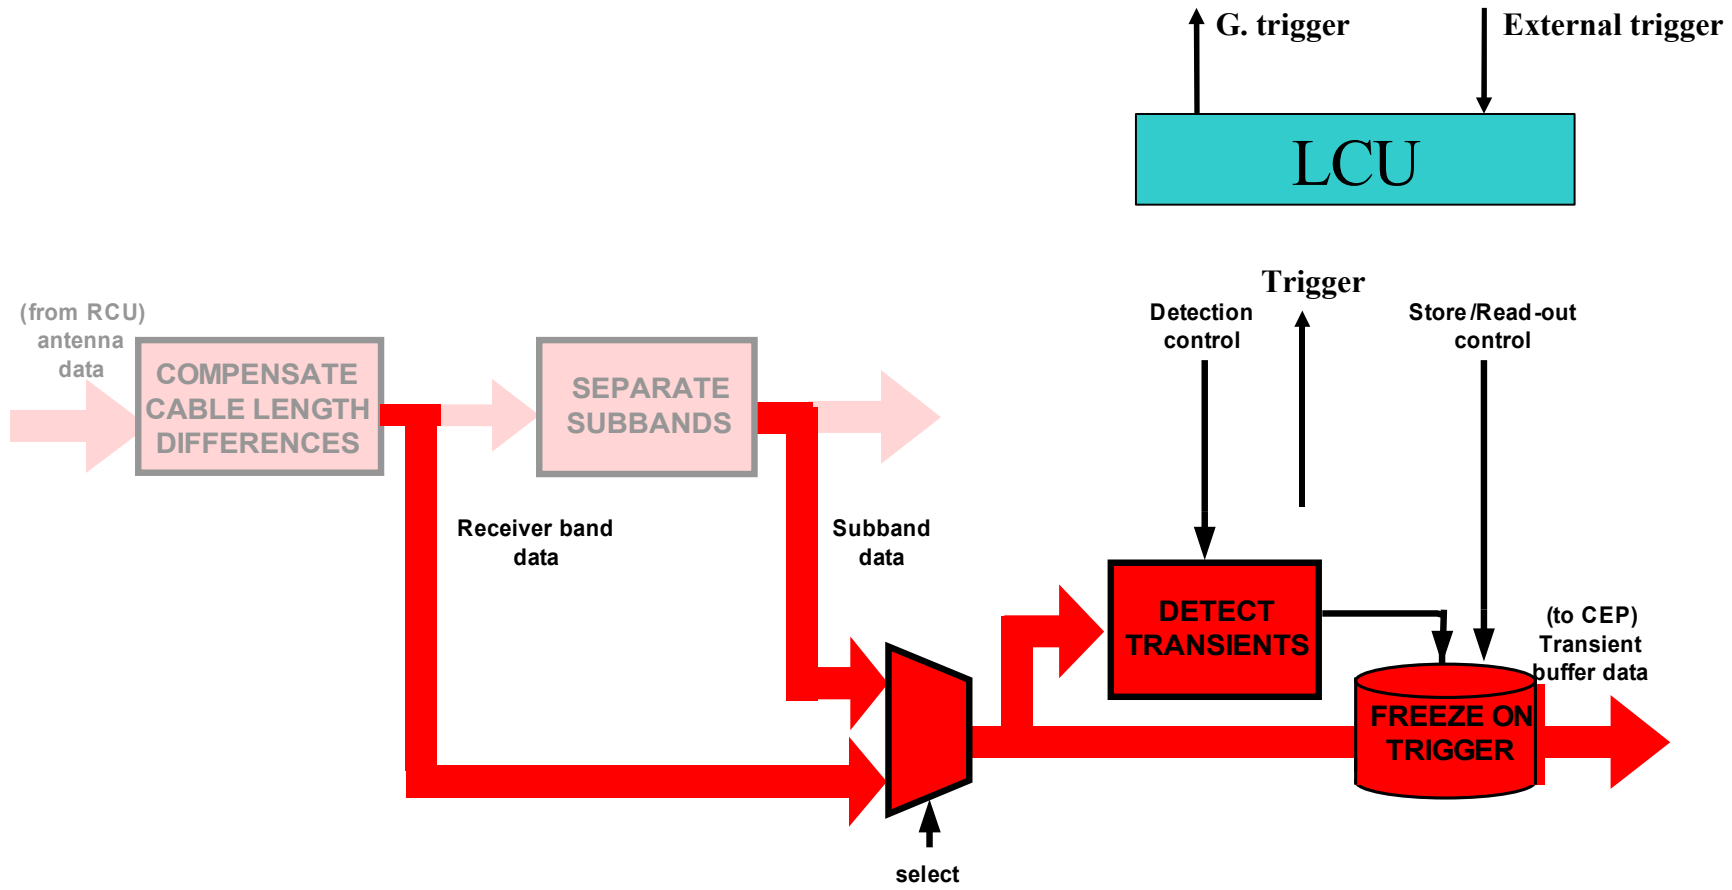

Cross correlation matrix of CS010

1182842764 - Tue, 26 Jun 2007 07:26:04 +0000

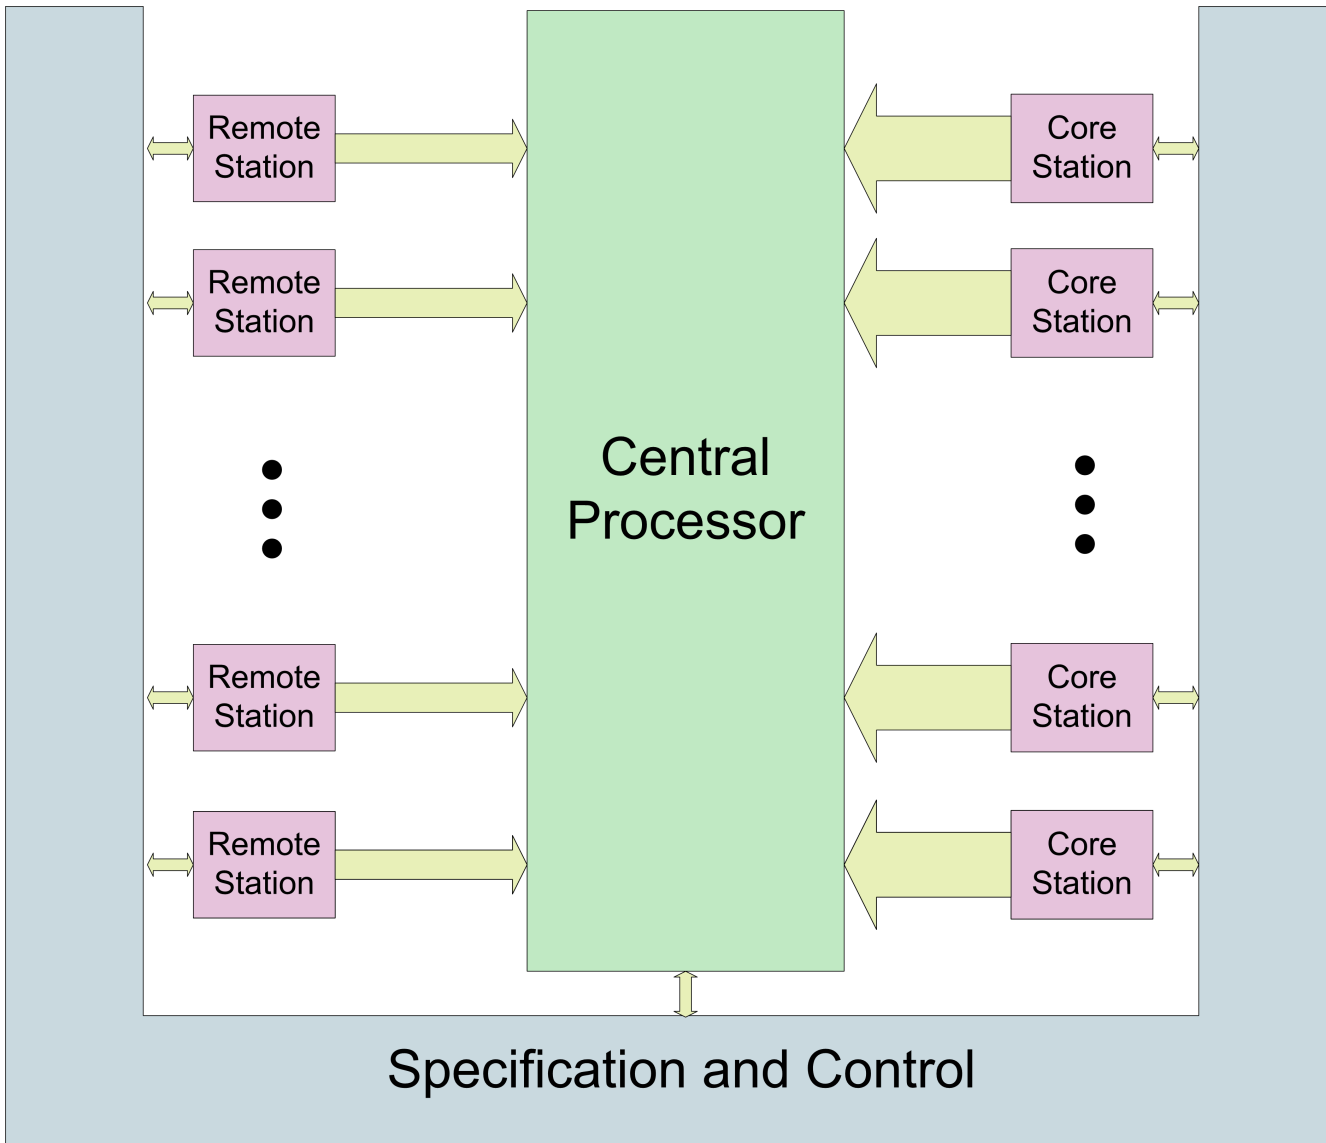

- Currently two (new) TBBs in the lab (of 12)
- All interfaces are tested
- The 1 Gigabit output interface is not working yet

TBB status (firmware and driver software)

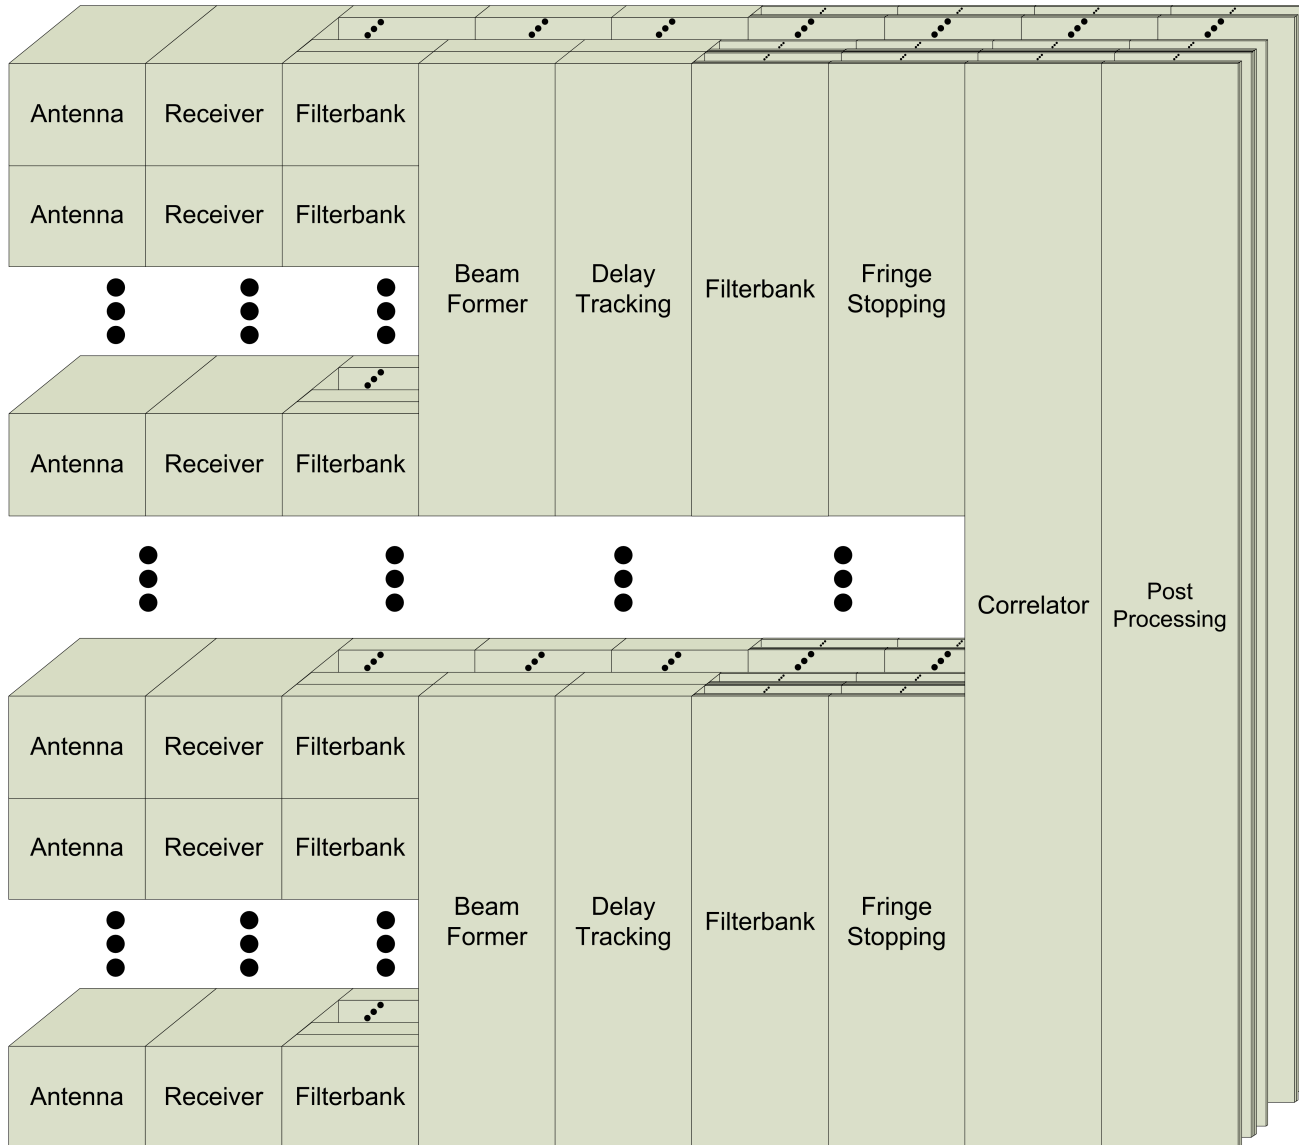

Core Stations

➤ Bandwidth too high for BG/L

➔ Reduction necessary of station data

Signal Processing Data Path

- Performance impact minimized solution
 - ☞ implement part of CEP processing in the field (expensive)

- Architectural impact minimized solution
 - ☞ reject or attenuate complete subbands incl. RFI

- Both cases: upgrade of remote station hardware necessary (Core Station Processing board)

- EOR mode requires all six racks of BG/L

- Processing pipeline works from antenna to dataproduct
- Engineering not finished yet
- TBF: HBA, TBB, core station, lots of software development
- Issues which pop up during commissioning needs to be solved

The End (of this talk)
