

LOFAR Calibration Scheme and Planning

Ronald Nijboer
ASTRON

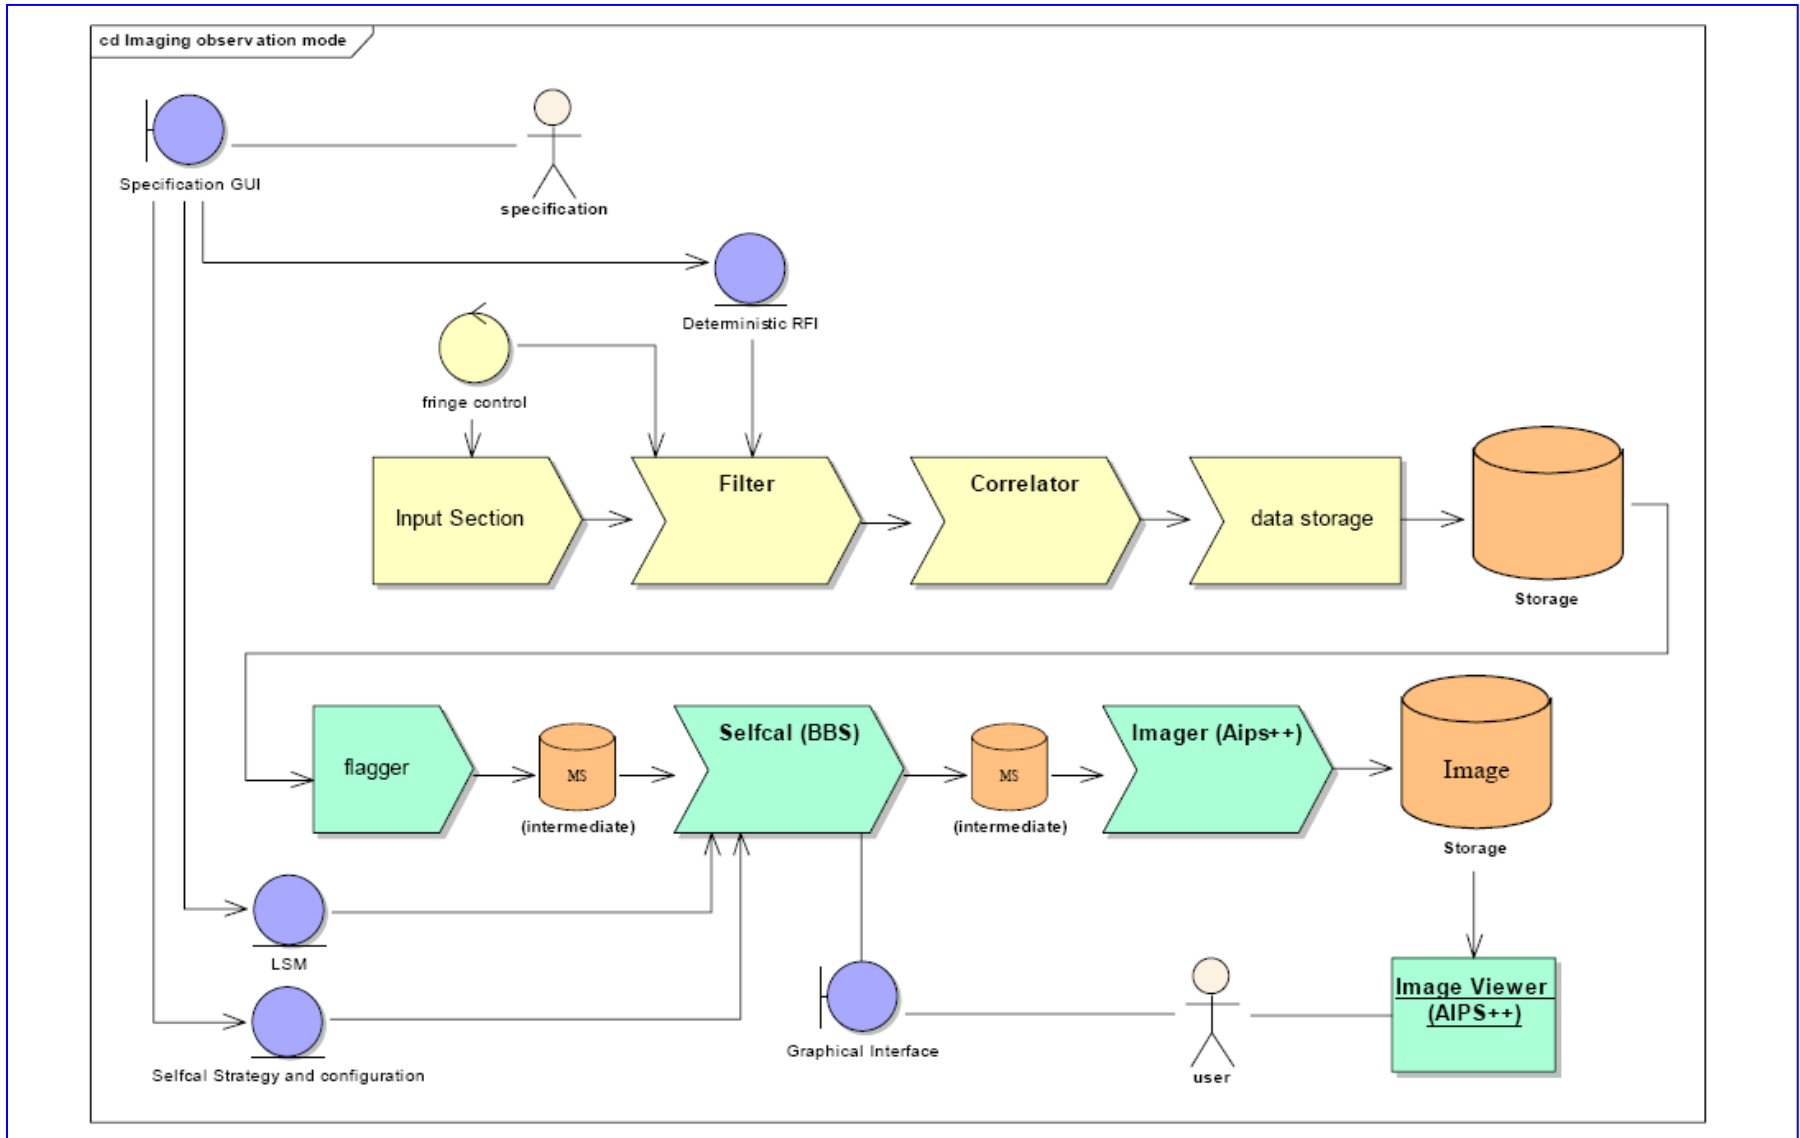

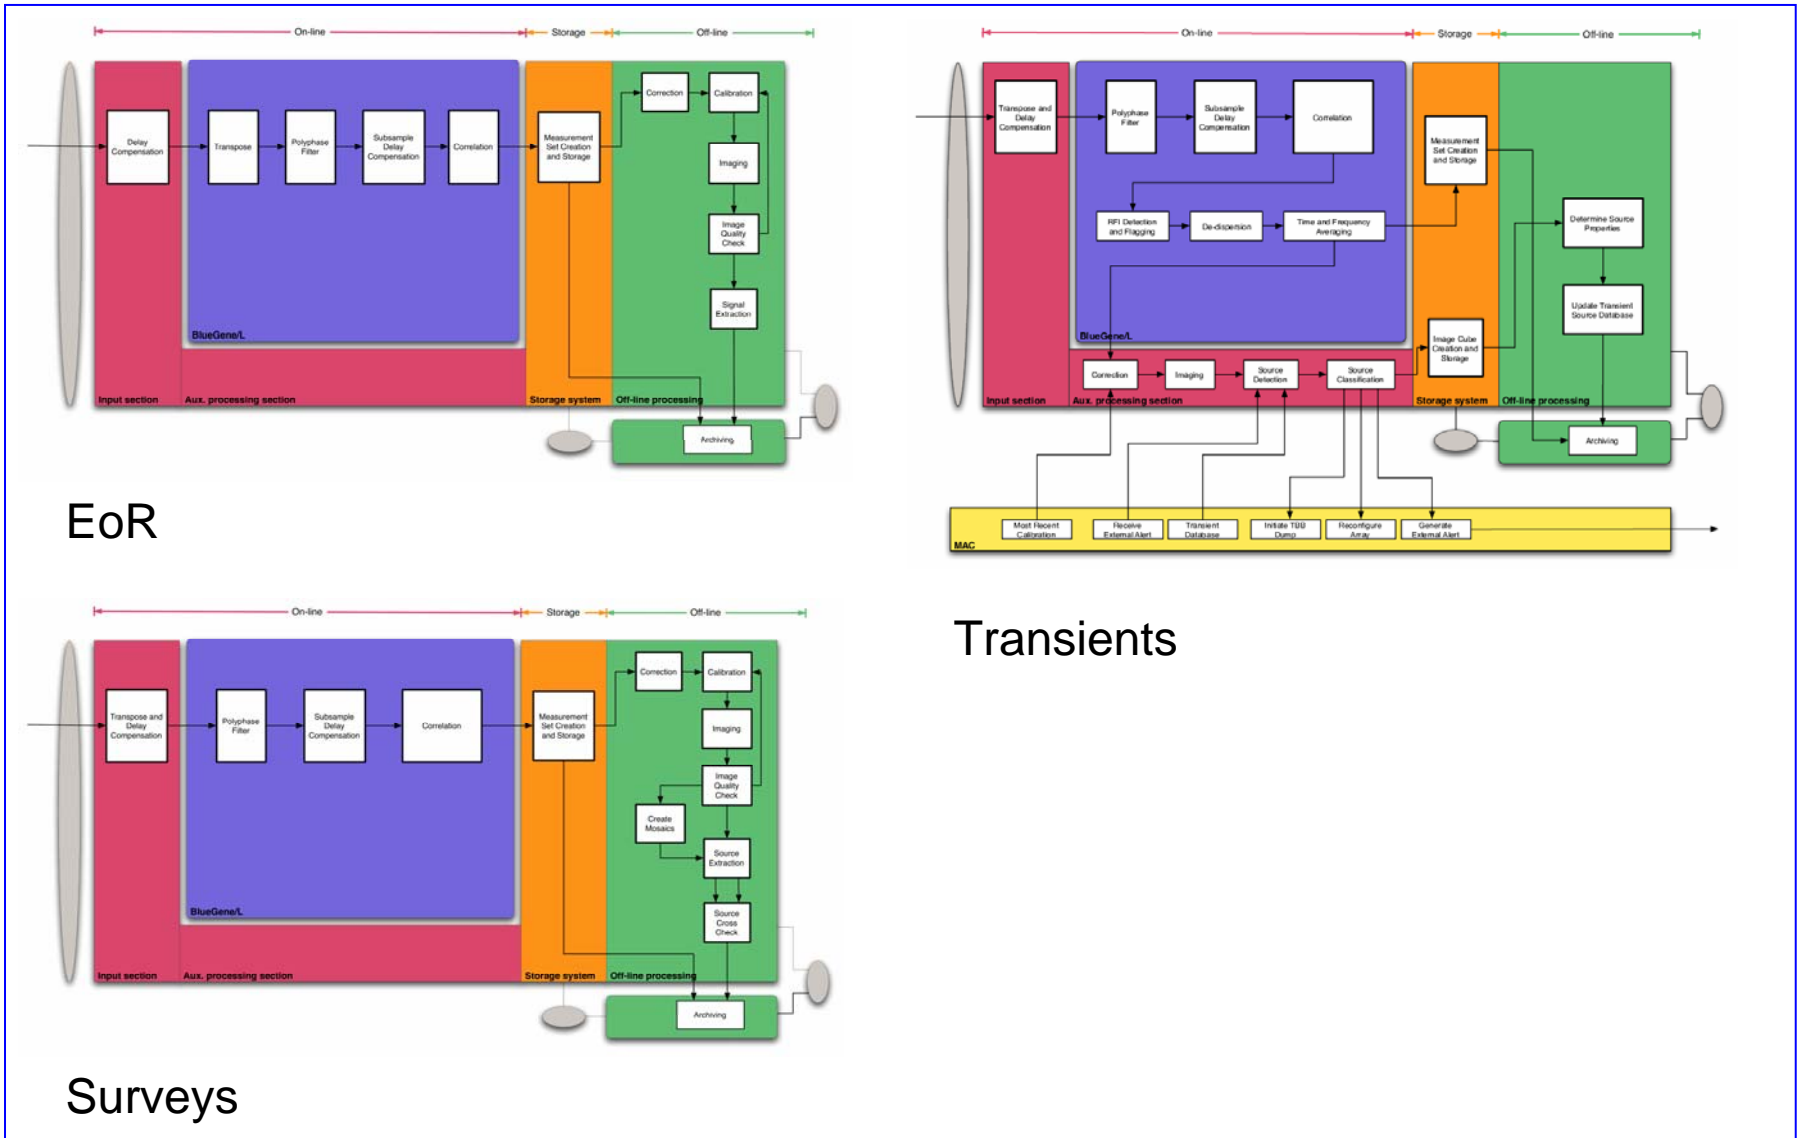

- On-line calibration ...
- Pre-processing steps
 - Flagging
 - Taking out the bandpass
 - Integration of data
- Calibration of uv-plane effects & fitting of ionosphere
 - Station gains (& clocks)
- Calibration of Image Plane effects
 - Cat. I Peeling (fit instrumental model)
 - Subtract Cat. I & II sources
 - Hierarchical Flagging
- Facet Imaging, deconvolution, source extraction, ...

- Pipeline software
 - Pre-processing, Calibration, Imaging (Yatawatta)
 - Data compression (Renting, Yatawatta)
- BBS
 - BBS kernel still being tested (Pandey, van Zwieten)
 - BBS control ready for distribution (Loose, van Zwieten)
- Imager
 - Currently AIPS++
 - Distributed Imager under development
 - Distributed Deconvolution under development

- LBA dipole and station beam model (Yatawatta)
 - Validation using solar flare observation
- Expansion model (Hamaker)
 - HBA configuration studies
- HBA test program (Brentjens)

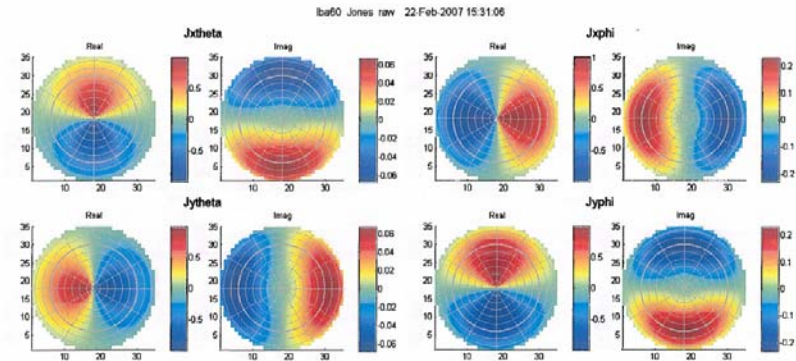

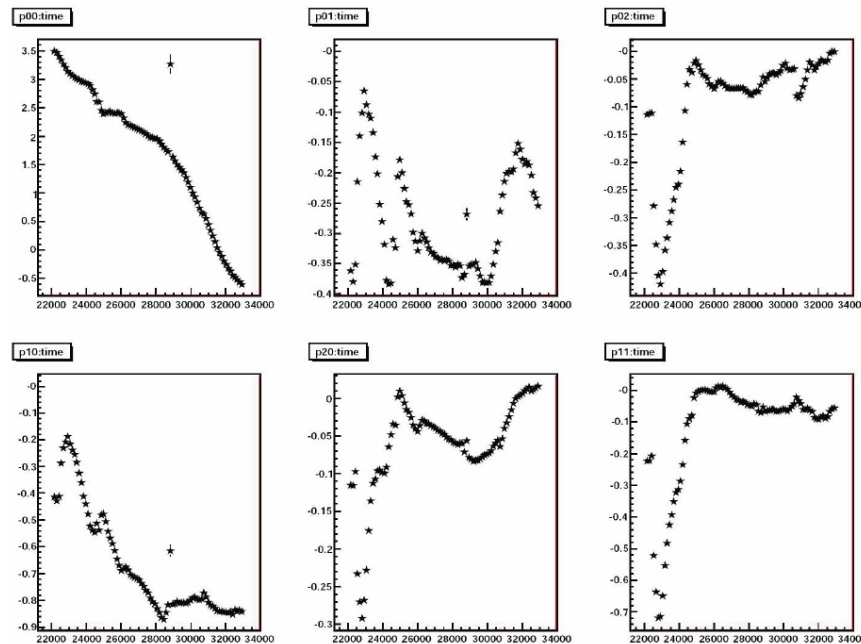

Figure 6: Beam at 80 MHz

Dipole beam by Sarod Yatawatta

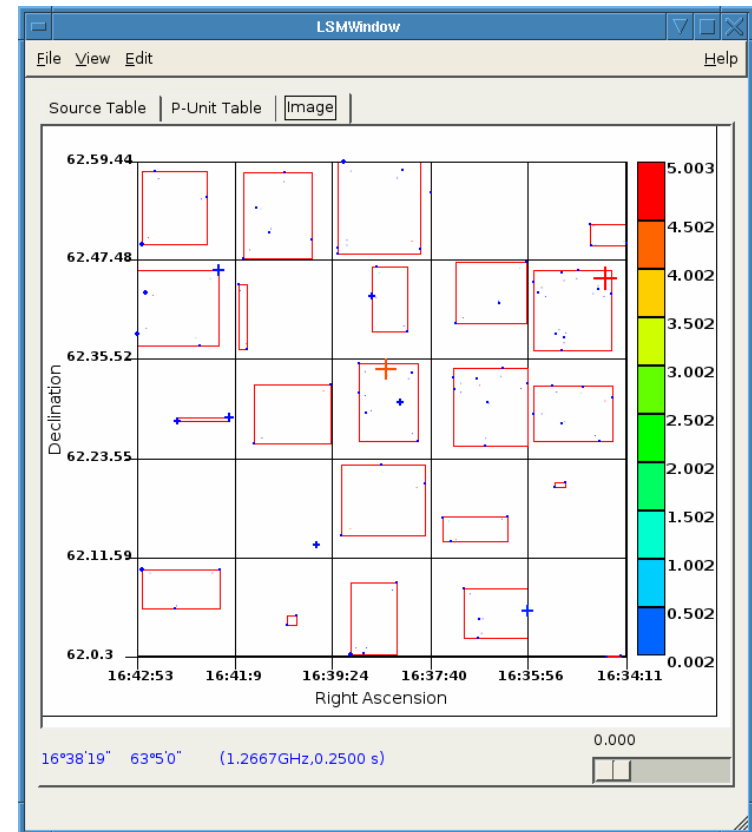

Dipole Jones matrix components by Johan Hamaker

- GPS data (Mevius, Anderson, Noordam)
- Ionospheric modelling with MeqTrees (Van Bemmelen)
- Estimation theory (Van der Tol)
- GMRT / VLA / CS1 (Omar)

MIM solution by Maaijke Mevius et al.

- VLSS based GSM for CS1 (Mohan, van Weeren)
- LSM prototype (Yatawatta)
- Source extraction prototype BDSM (Mohan)
- Absolute flux scale

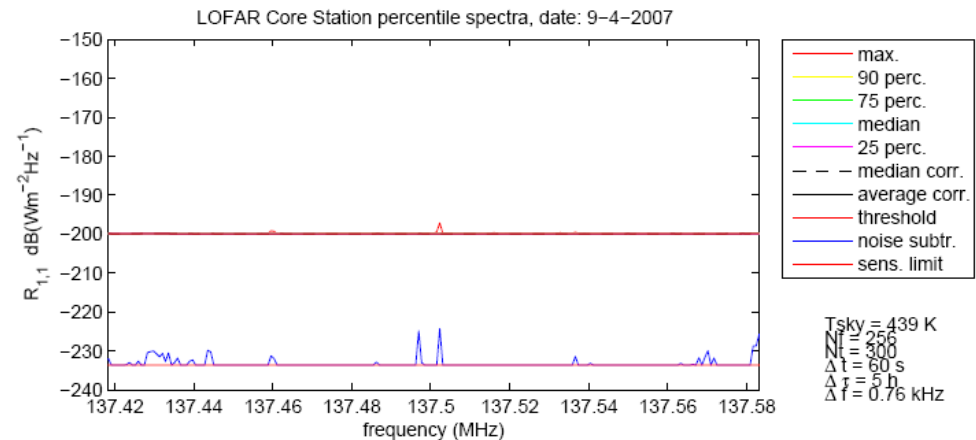

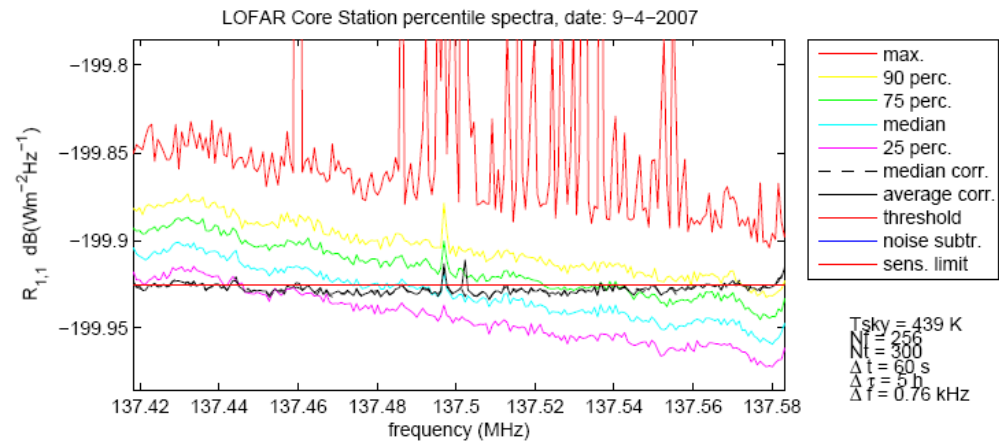

LSM prototype by Sarod Yatawatta

- Off-line cluster (Nijboer, Romein)
- Selfcal flops (Brentjens)
- Selfcal scaling (Bregman)
- Scale towards 20 stations (LOFAR20):
 - What kind of operation is foreseen?
 - What kind of data product / resolution is foreseen?
 - What kind of Calibration approach is foreseen?
- Pipeline steps (Yatawatta, Renting)
- Simulation of Peeling (Intema)
- Peeling from estimation theory perspective (Van der Tol, Jeffs)

- LBA & HBA system validation (Wijnholds)
- DR of CS1 images (Yatawatta, Noordam, de Bruyn)
- MeqTree simulator: Siamese (Smirnov)
- Simulations plan (Noordam)

- MS to MATLAB converter (Harmen Jeuring)
- High Band spectrum environment (Boonstra)
 - Taking out analogue and digital passbands
 - Correcting for linear gradient
- High Band cleaner than expected (Low Band even cleaner)

LOFAR Core Station HBA Spectrogram, $R_{1,1}$, date: 9-4-2007

- Software development
 - Incorporate additional functionality
 - Cope with more data
 - Make it run under SAS / MAC

- Better understanding of the Calibration
 - By looking at CS1 data
 - By comparing with simulations
 - FT images back to uv-domain

- How do we get deeper in the map (without extra data)?
 - Use larger domains / funklets

- Development of pipelines
 - First uv-plane correction (clocks), then Peeling
 - Correcting for directions we don't solve for
 - Intrinsic sky map?
 - Compare XX and YY images?
 - KSP specific
- Simulation plan
 - What is the effect of the PSF in the map?
 - What is the effect of w-projection in the map?
 - Simulated VLSS sky vs. CS1 measured sky
 - Ionosphere
- Input for off-line cluster design
 - Pulsars
 - Cosmic Rays
