

LOFAR

Seismic observations on the moon: seismic interferometry and moonquakes

Guy Drijkoningen
Kees Wapenaar
Deyan Draganov
Elmer Ruigrok

Delft University of Technology

Outline

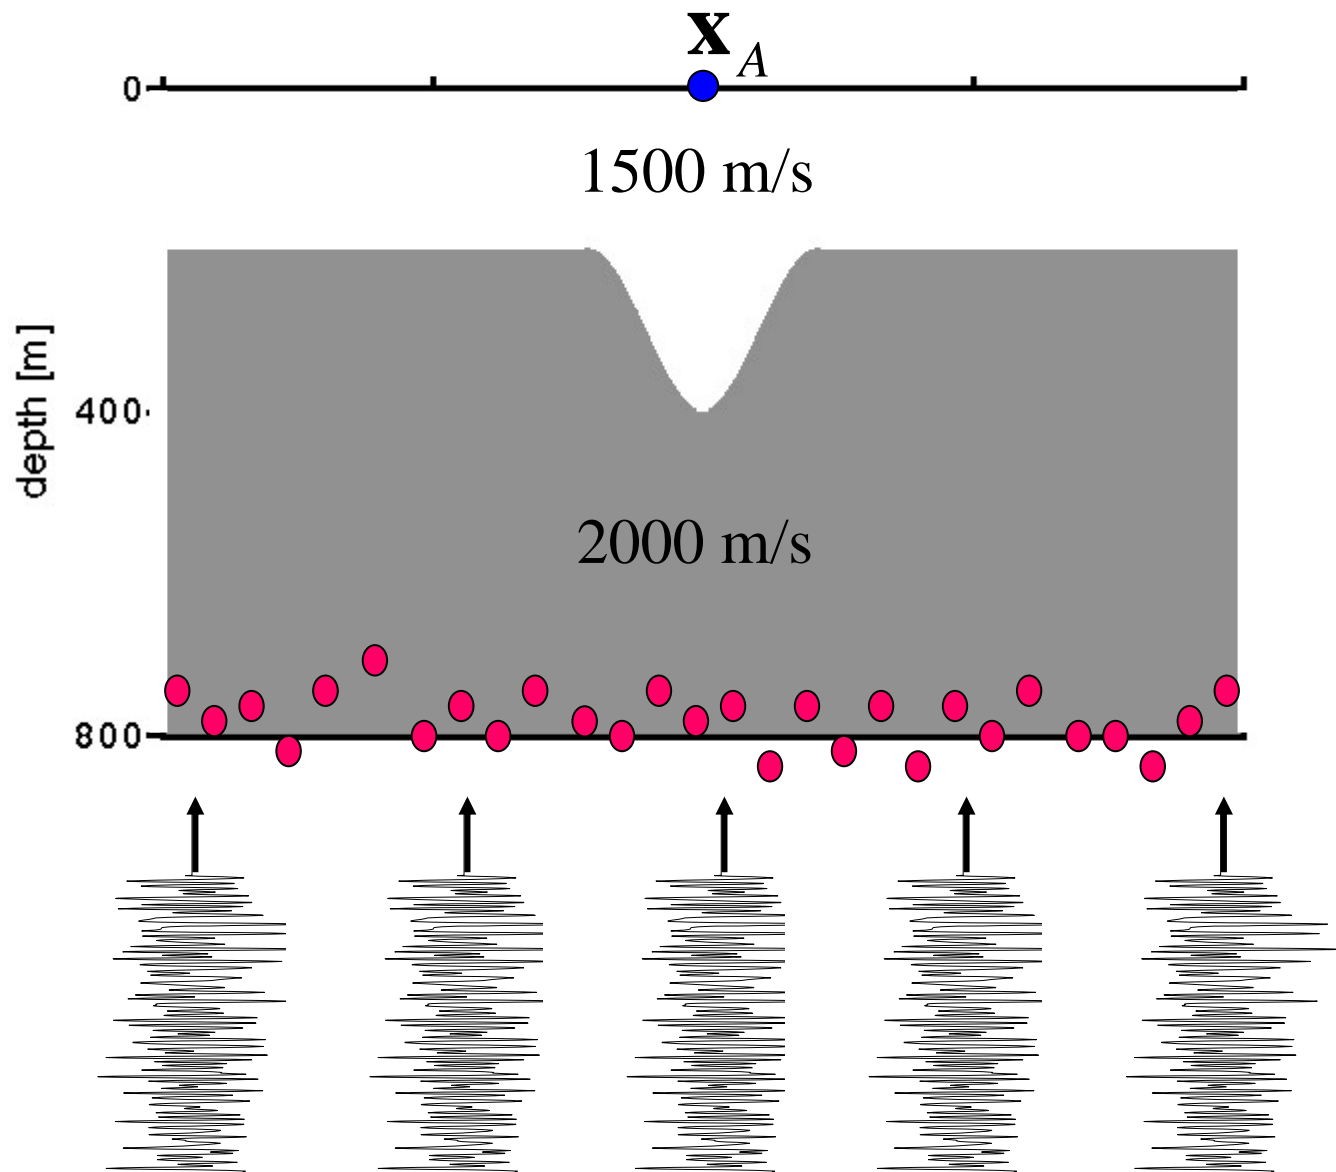

- **Seismic Interferometry**
- **LOFAR**
- **US array**
- **Moonquakes**
- **Seismic observations on the moon**

Outline

- **Seismic Interferometry**
- LOFAR
- US array
- Moonquakes
- Seismic observations on the moon

Seismic Interferometry

- Pioneering work by K. Wapenaar
- Currently validation on earth:
 - works for direct surface waves
 - works for active (man-made) sources
 - works for scattered waves ??
 - works for passive sources ??

Seismic Interferometry

Transmission measurements

correlation

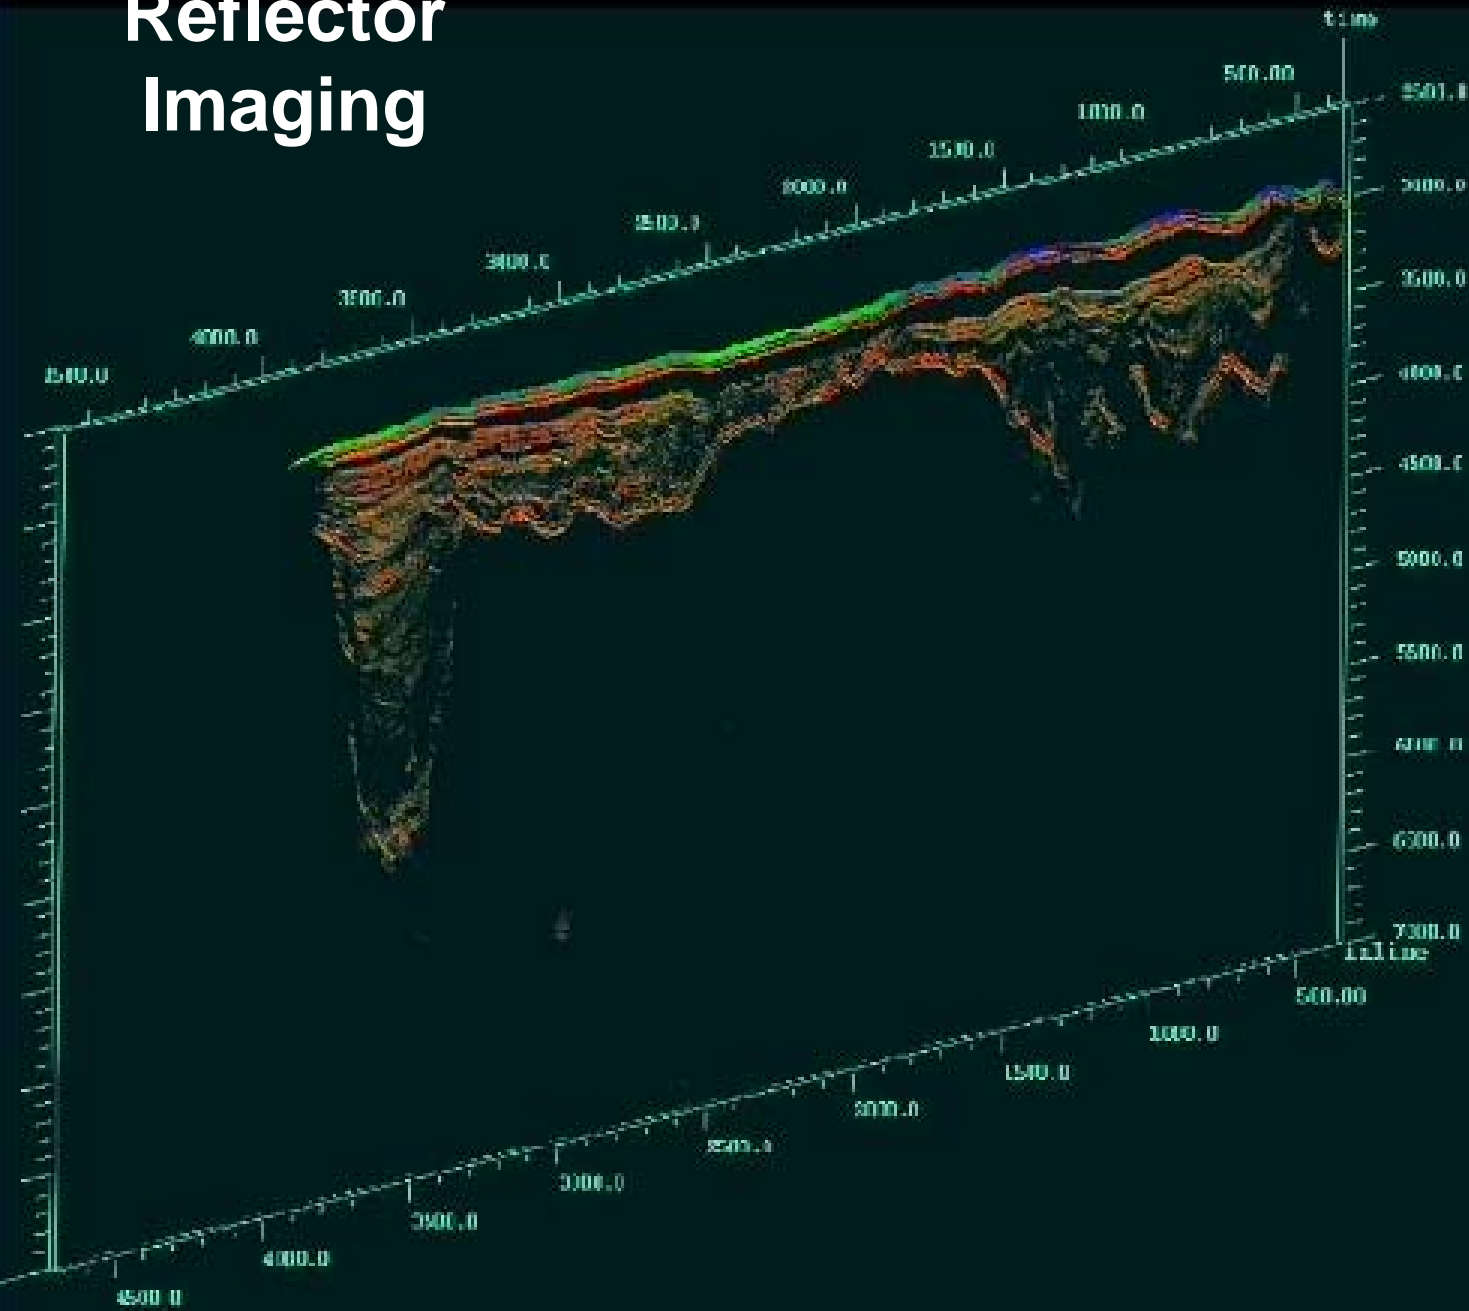

Reflection measurements

Reflector Imaging

Reflection measurements

Reflector Imaging

Interferometry:

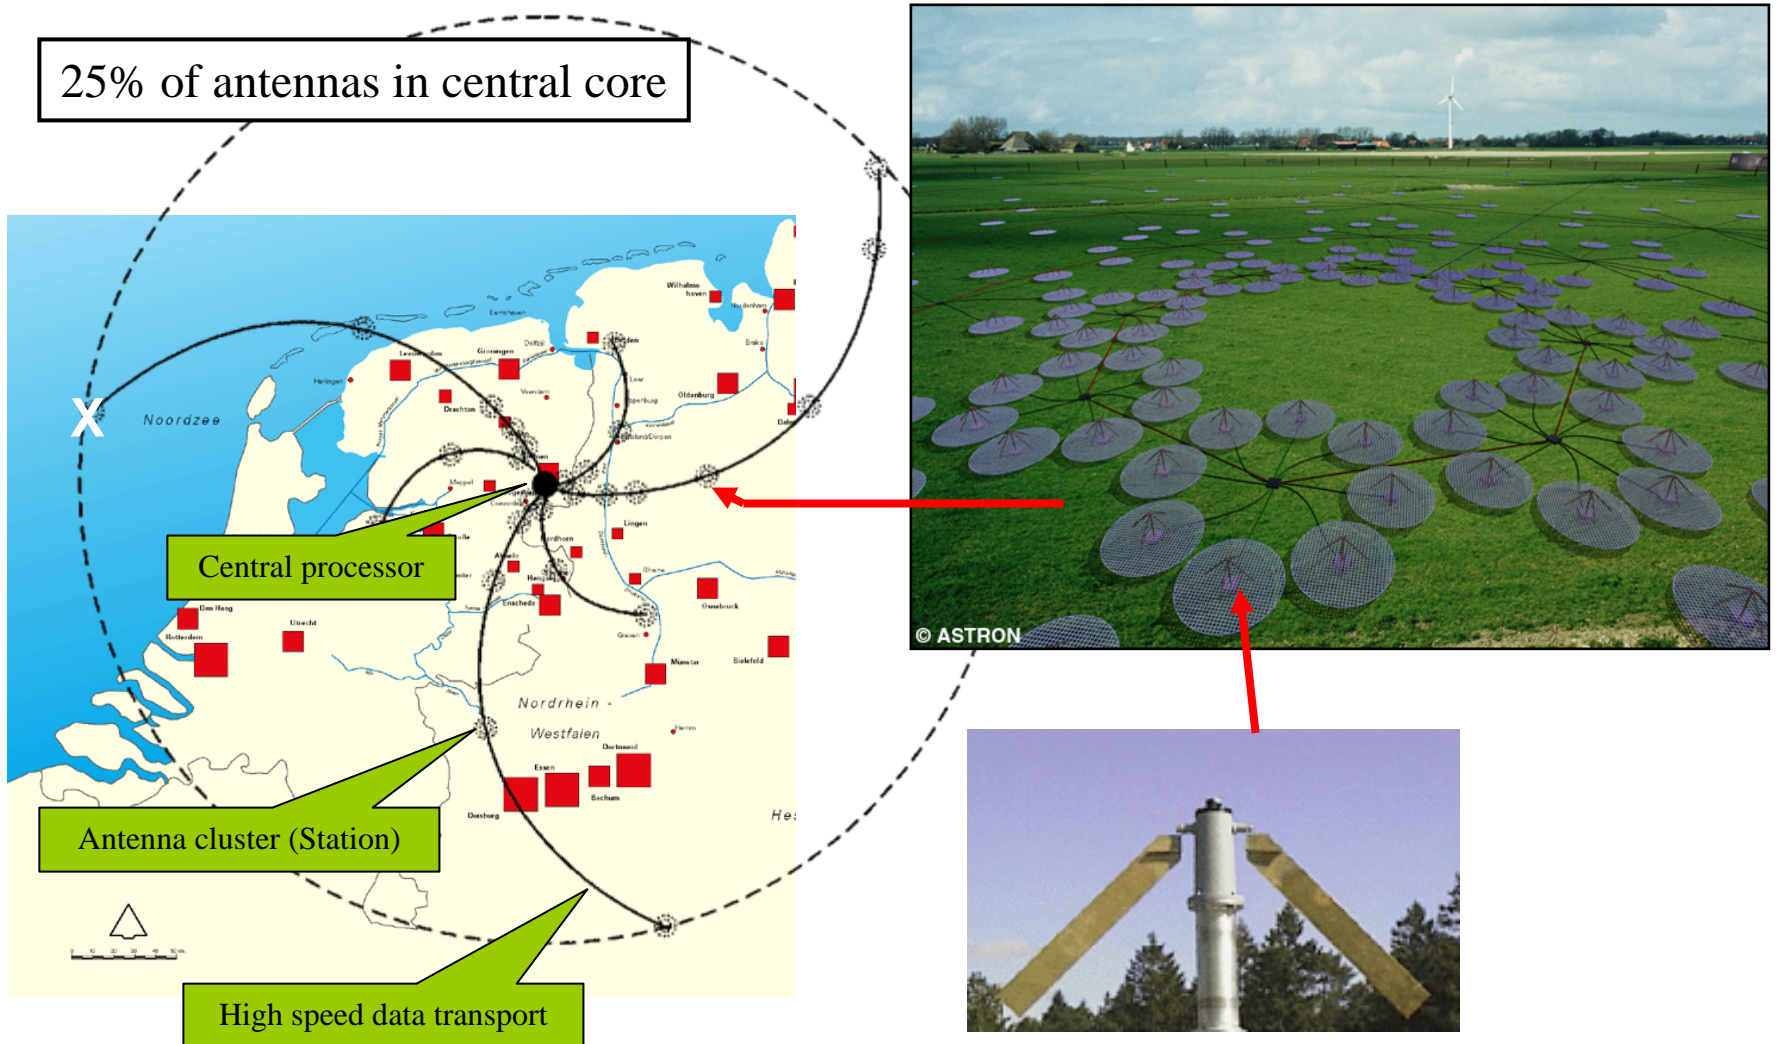

Differences with astronomy:

- **Strongly inhomogeneous propagation model**
- **Reflection instead of source imaging**
- **Sky moving while earth static (losing 1 dimension)**

Outline

- Seismic Interferometry
- **LOFAR: crust scale**
- US array: earth scale
- Moonquakes
- Seismic observations on the moon

LOFAR: LOW Frequency ARray

Test-site Exloo

Test-site Exloo

Quake 08 August 2006: tapered filtered(0-2-35-45) GEOPHONES

(Vertical component of geophones)

First arrival

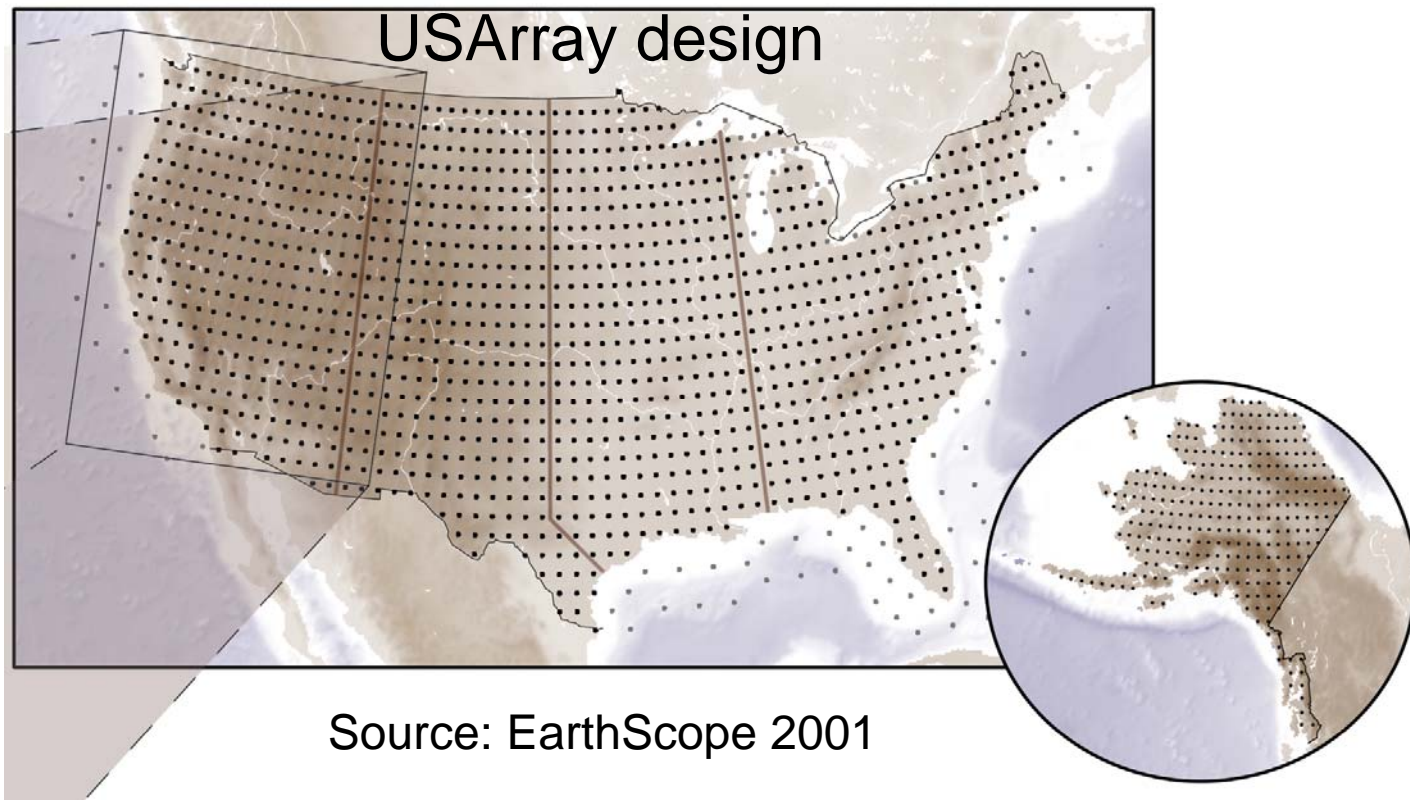

Earthquake 08 August 2006, Recording at LOFAR test-site

Outline

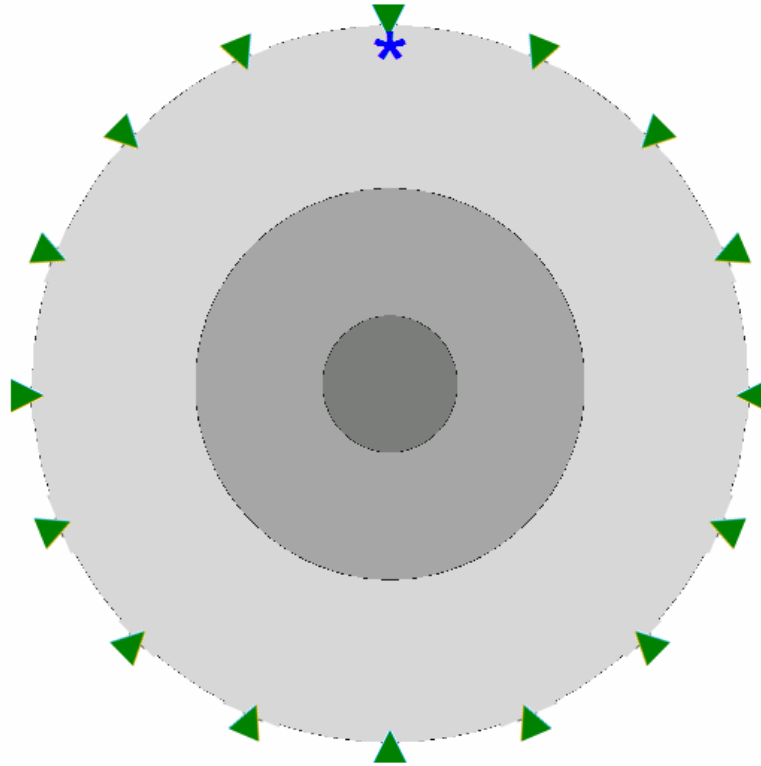

- Seismic Interferometry
- LOFAR: crust scale
- **US array: earth-scale**
- Moonquakes
- Seismic observations on the moon

US array

Seismic Interferometry on global-scale seismology

All epicentral distances

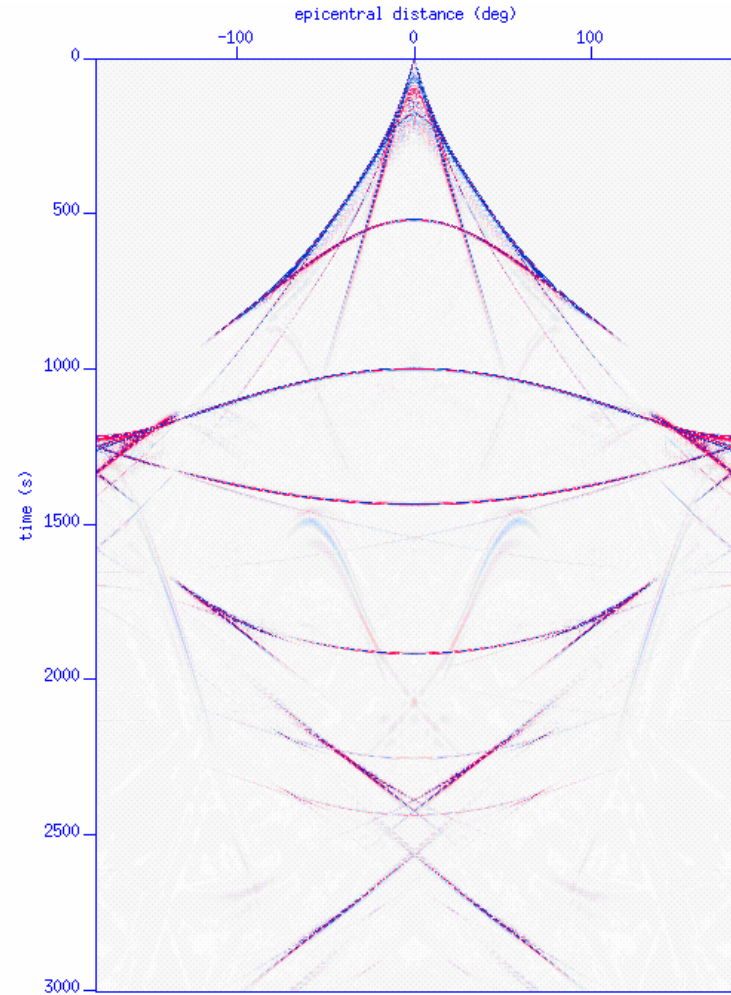

Causal result

Reconstructed

Directly modeled $G_0^{p,f}(\mathbf{x}, \mathbf{x}_B, t)$

Outline

- Seismic Interferometry
- LOFAR
- US array
- **Moonquakes**
- Seismic observations on the moon

- SEISMOGRAPHS ✕
- NORMAL MOONQUAKES ▲
- SHALLOW MOONQUAKES ●

LUNAR RADIUS 1738 KM
 CORE RADIUS 1100 KM
 CRUSTAL THICKNESS 60 KM

**Some background on the seismology of Moonquakes.
 G.A. EIBY: "EARTHQUAKES"**

Three causes of lunar seismicity:

- Impacts
- Shallow: 0-60 km (crustal stresses)
- Deep : 600 – 900 km (tidal forces)

Features:

- 'High' frequency (0.1 – 1.0 Hz)
- Small amplitudes (0.5 – 1.3 Richter)
- Low damping
- Long reverberations (~ 60 minutes)

Outline

- Seismic Interferometry
- LOFAR
- US array
- Moonquakes
- **Seismic observations on the moon**

Idea:

- Not a few but *many* stations: only then structure can be imaged
- Light-weight low-power sensors:
 - Micro-machined sensors

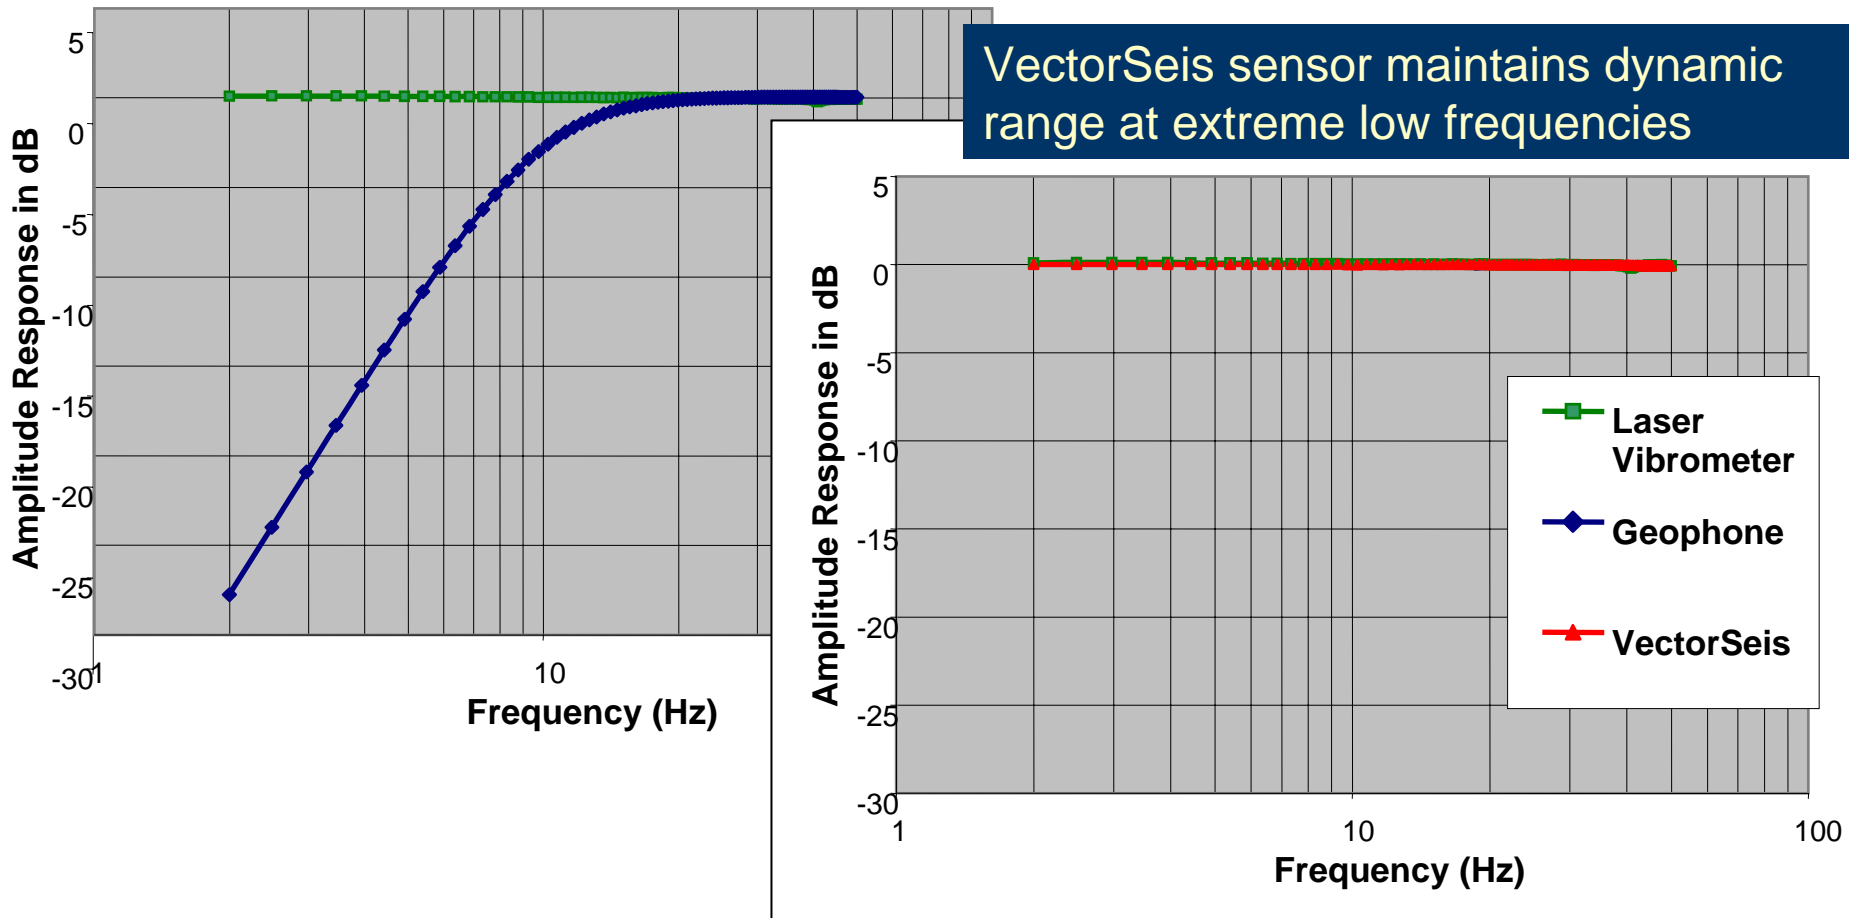

VectorSeis[®] Digital Sensor

- No tilt limitations

Frequency Response

Geophone & VectorSeis[®] simultaneously shaken, table motion measured by Laser Vibrometer, Geophone and VectorSeis outputs normalized to Vibrometer

Thank you for your attention
