

An HI view of the on-going assembly of early-type galaxies

Paolo Serra

- Early-type galaxies and the Atlas^{3D} survey
- Preliminary results on HI in ETGs
- Prospects for the study of HI in ETGs with Apertif
- Conclusions

Early-type galaxies appear as a very homogeneous family: tight scaling relations, relaxed morphology, strong clustering, old stellar populations, gas-poor (thus passively evolving)

However:

- KDCs, internal discs
- morphological fine structure (shells, ...)
- residual star formation (more recent in the field?) and associated CO
- extended regions with ionised-gas (LINER-like line ratios)
- neutral hydrogen

A volume-limited multi-wavelength survey of 263 early-type galaxies within ~ 40 Mpc

Optical integral-field spectroscopy (WHT/SAURON)

Optical imaging (INT+SDSS)

CO (IRAM+CARMA)

HI (WSRT)

archival 2MASS, GALEX, XMM-Newton, Chandra

semi-analytic models

N-body simulations

PIs: Cappellari and Kranjovic (Oxford), Emsellem (ESO), McDermid (Gemini)

Bacon and Bois (Lyon), Blitz and Alatalo (Berkeley), Bournaud (SACLAY), Bureau, Davies and Kochfar (Oxford), de Zeeuw and Kuntschner (ESO), Falcon-Barroso (IAC), Morganti, Oosterloo and Serra (ASTRON), Sarzi (Univ. Hertfordshire), van den Bosch and Weijmans (Leiden), Verdoes Kleijn (Kapteyn), Van de Ven (Institute Advanced Studies), Young (New Mexico Tech), Naab (Muenchen)

$M_K < -21.5$ ($K < 11.6$ @ dist_{max})

$\text{dist} < 42$ Mpc mostly SBF

$|\delta - 29| < 35^\circ$

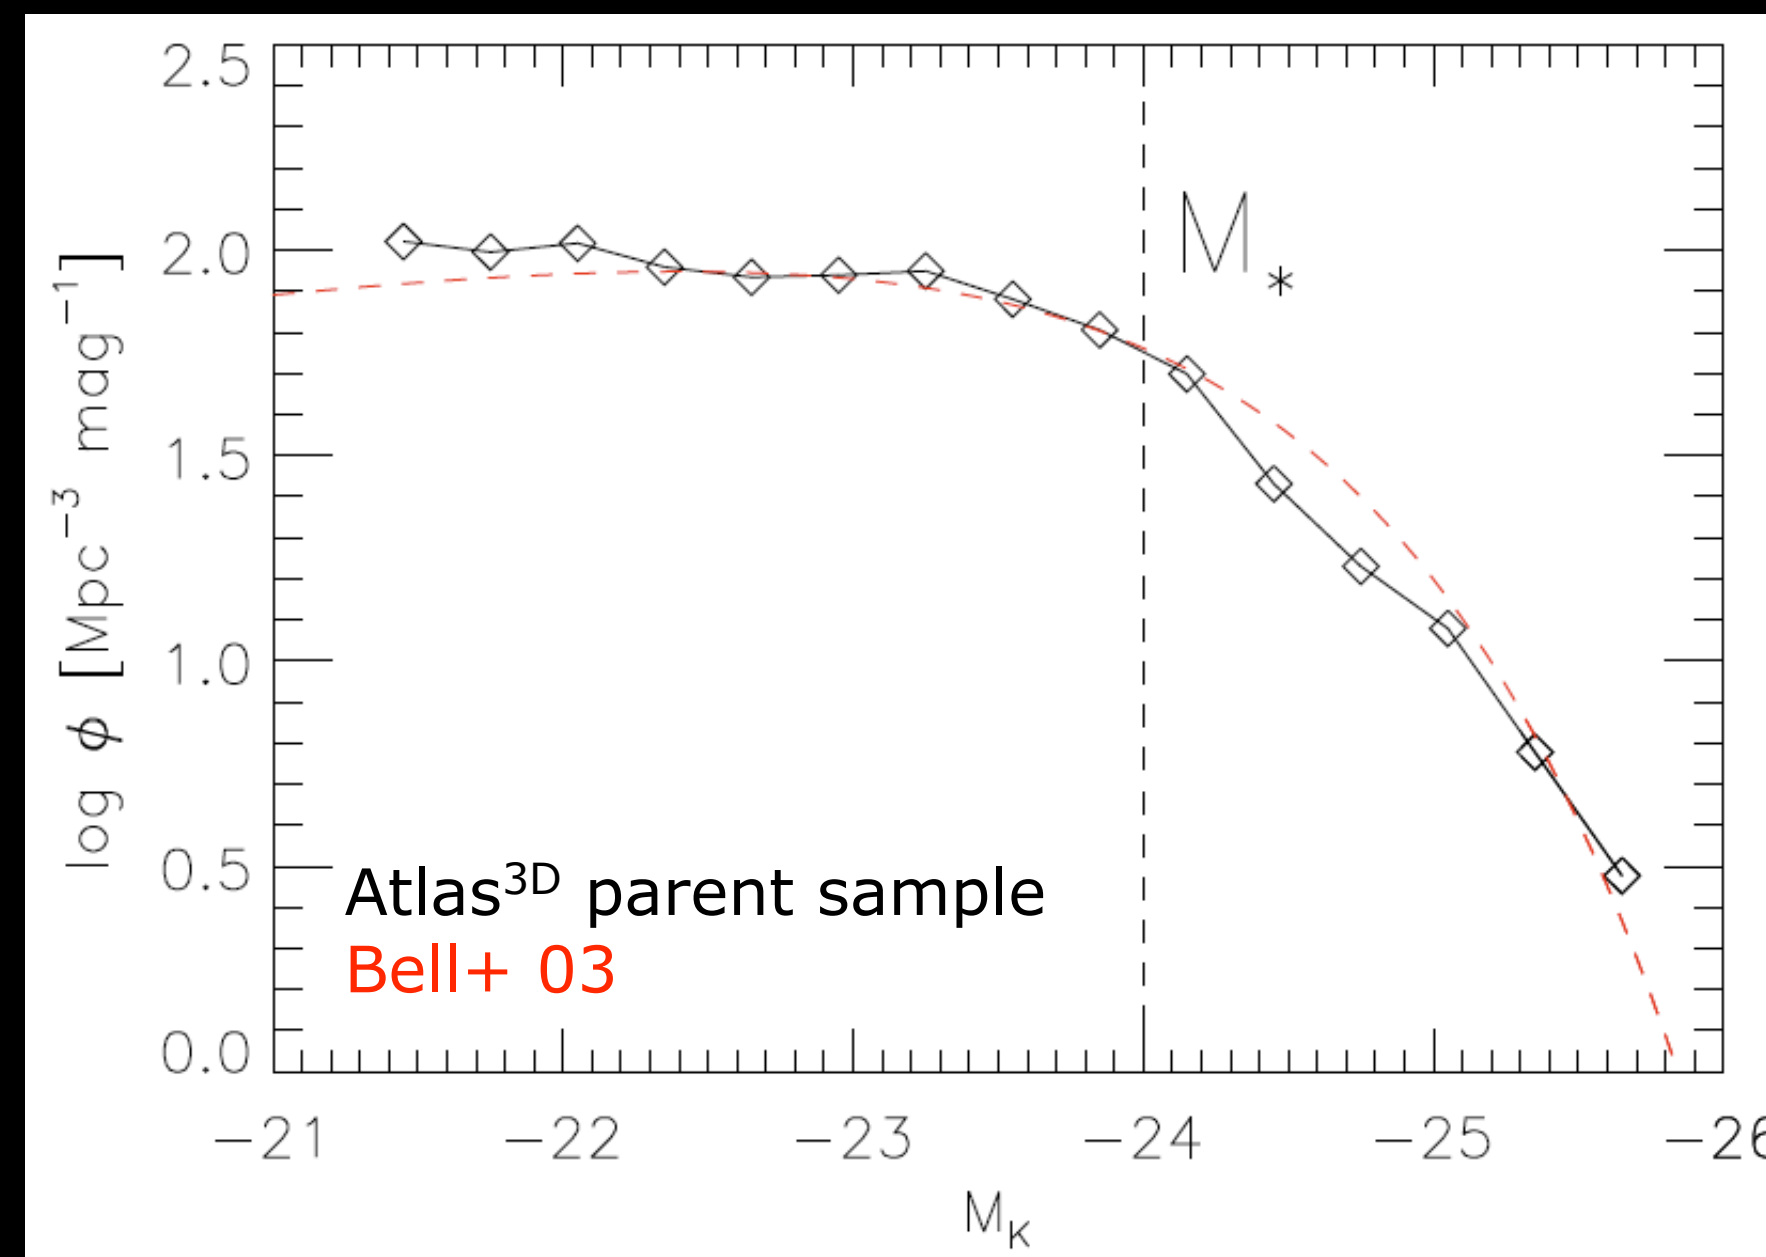

$|b| > 15^\circ$

Morphological classification by eye
(82% SDSS, else DSS2-blue)
Main criterion: no spiral arm

263 ETGs (Virgo included)

$M_K < -21.5$ ($K < 11.6$ @ dist_{max})

$\text{dist} < 42$ Mpc mostly SBF

$|\delta - 29| < 35^\circ$

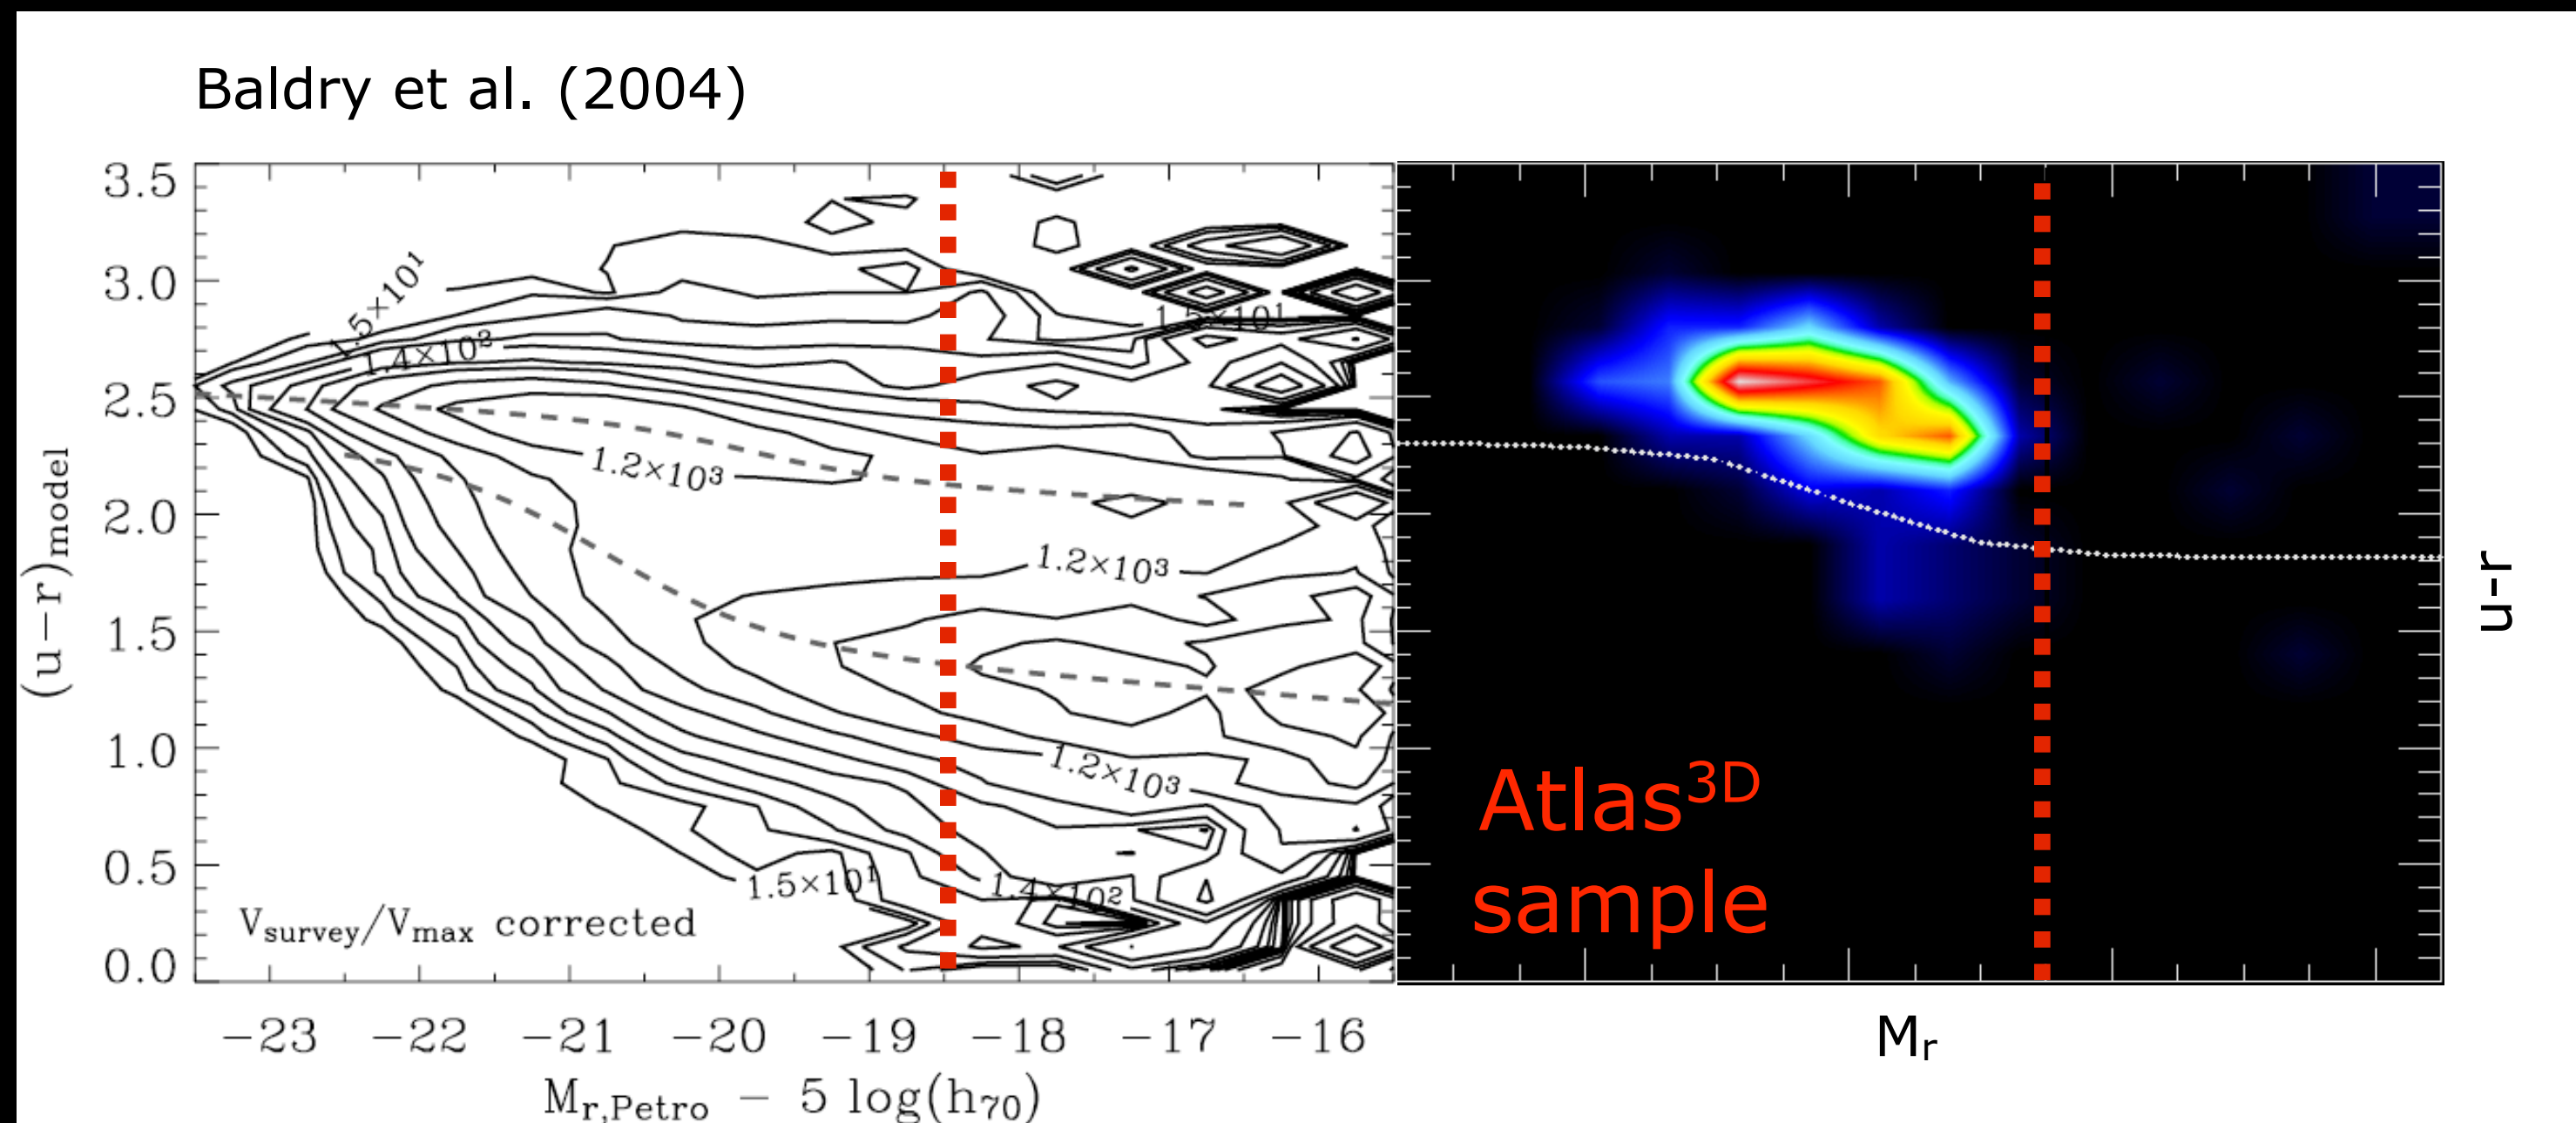

$|b| > 15^\circ$

Morphological classification by eye
(82% SDSS, else DSS2-blue)
Main criterion: no spiral arm

263 ETGs (Virgo included)

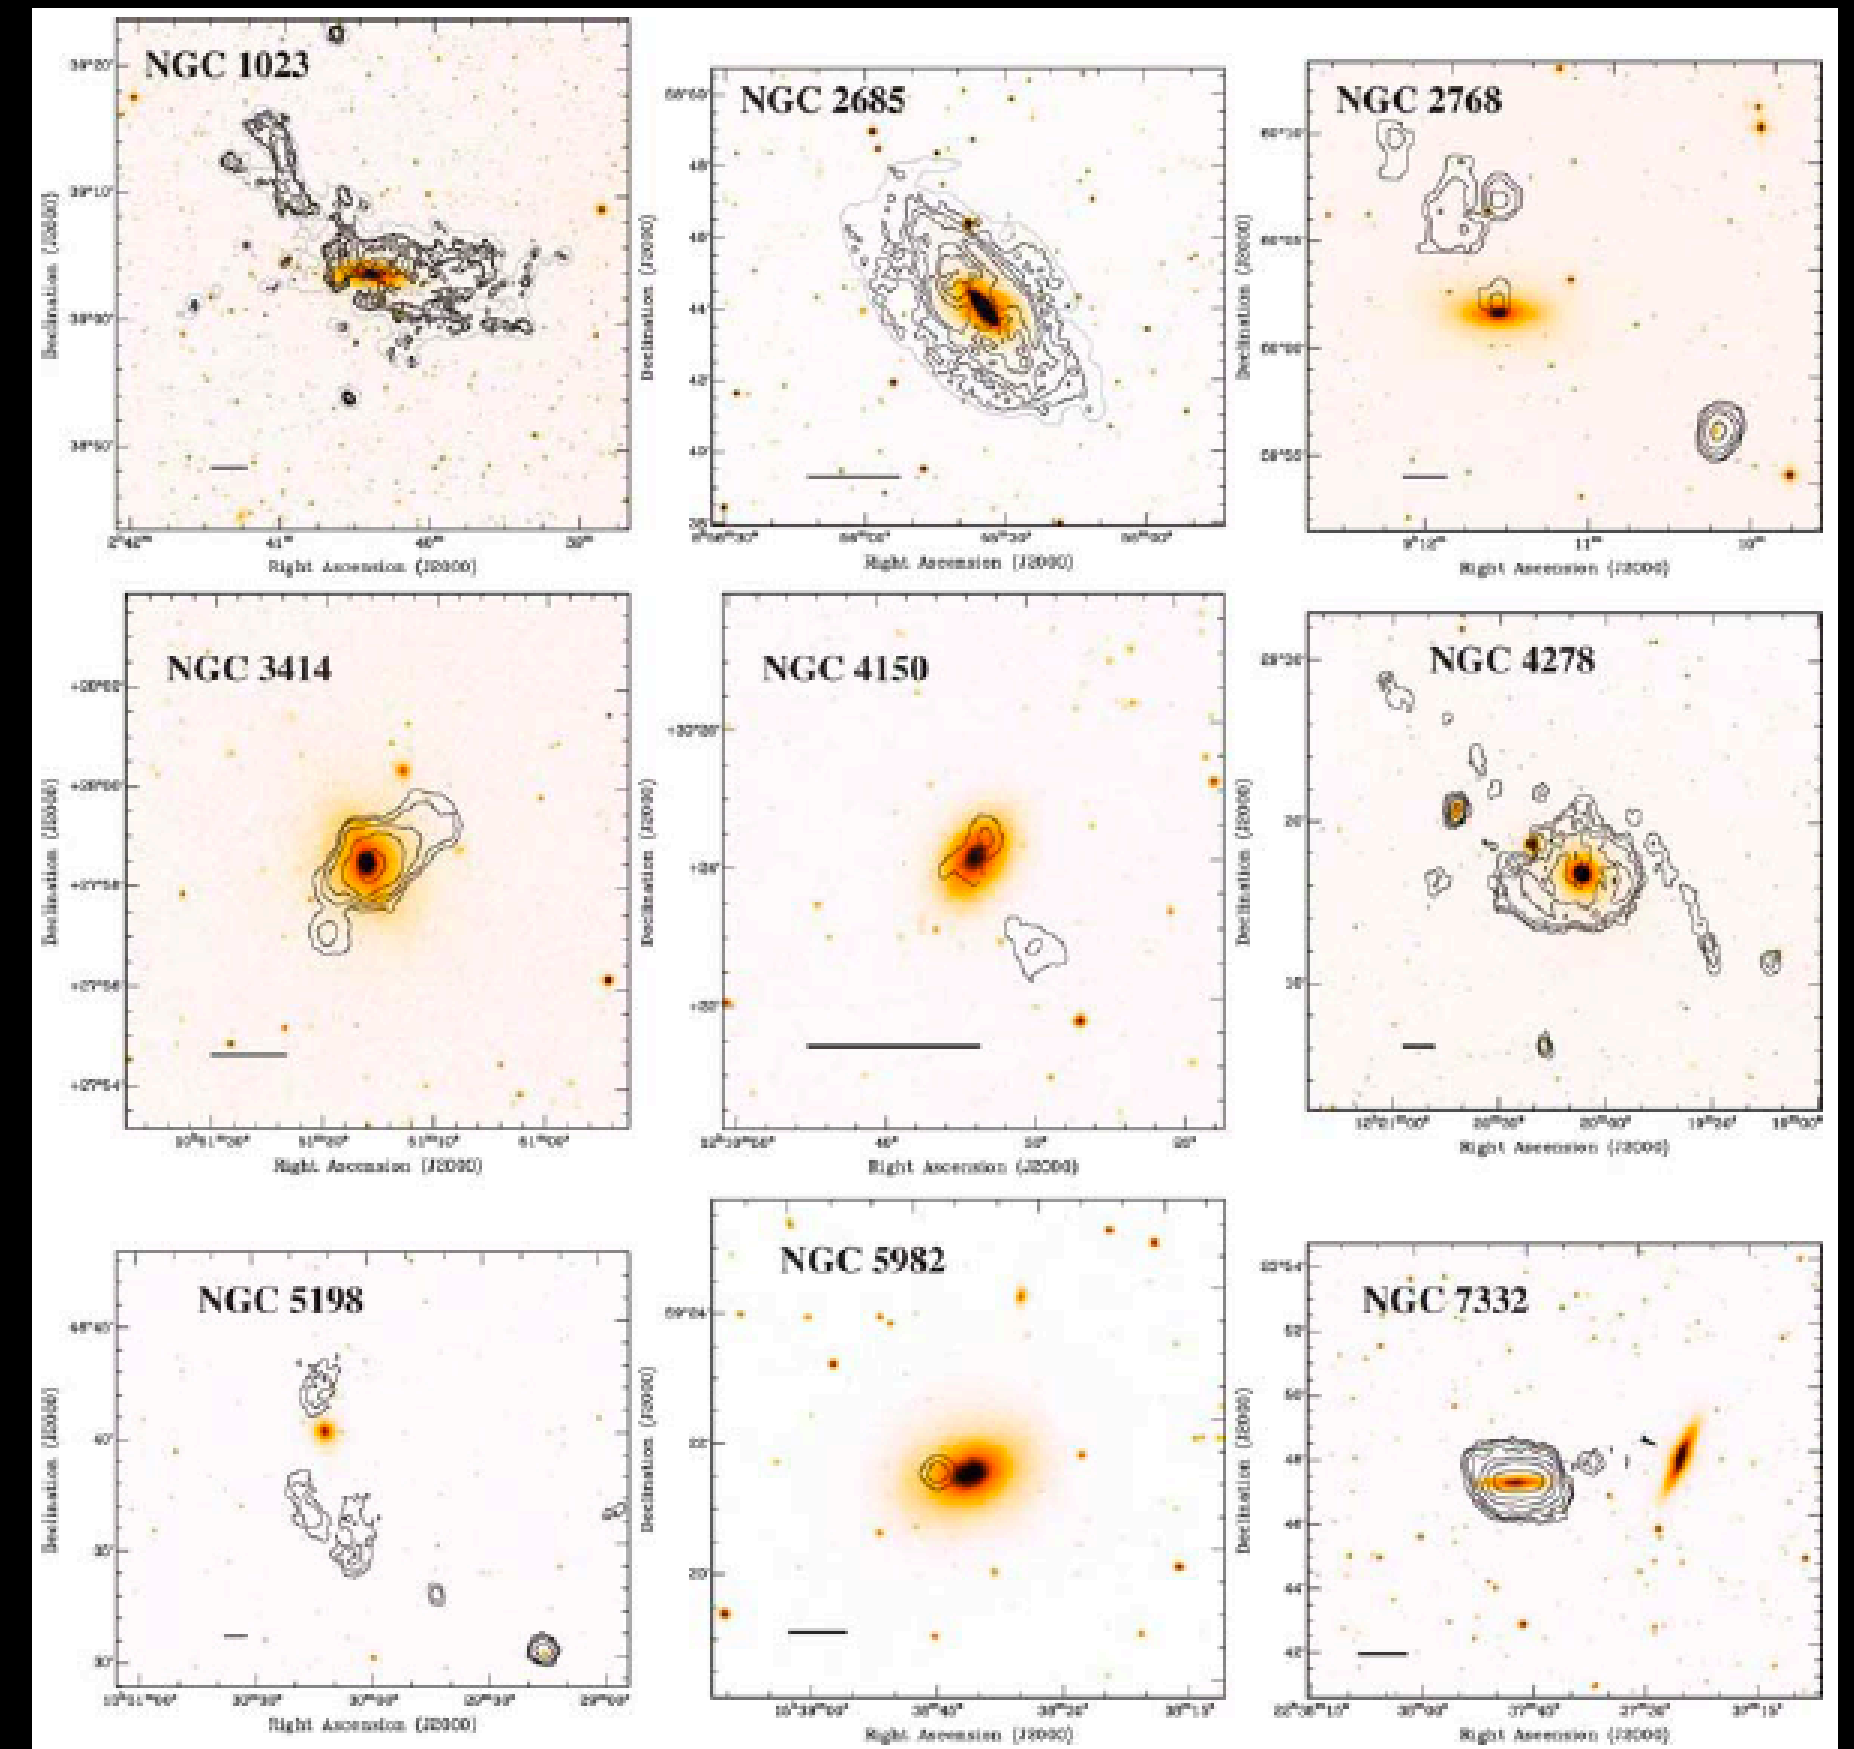

Significant fraction of the ISM

Detection rate:
30-70% in the field
~1% in the cluster

$M(\text{HI}) = 10^6 - 10^{10} M_{\odot}$
spread over tens of kpc

$n_{\text{HI}} < 10^{20} \text{ cm}^{-2}$

(Morganti+ 06, Oosterloo+ 07, Grossi+ 09)

So far, no relation with stellar properties (luminosity, stellar age, kinematics),
some relation with other gas phases, BUT poor statistics

dec > 10 deg:

all non-Virgo galaxies => 127 ETGs (full synthesis)

Virgo galaxies detected in Alfalfa (7/44)

dec > 10 deg:

all non-Virgo galaxies => 127 ETGs (full synthesis)

Virgo galaxies detected in Alfalfa (7/44)

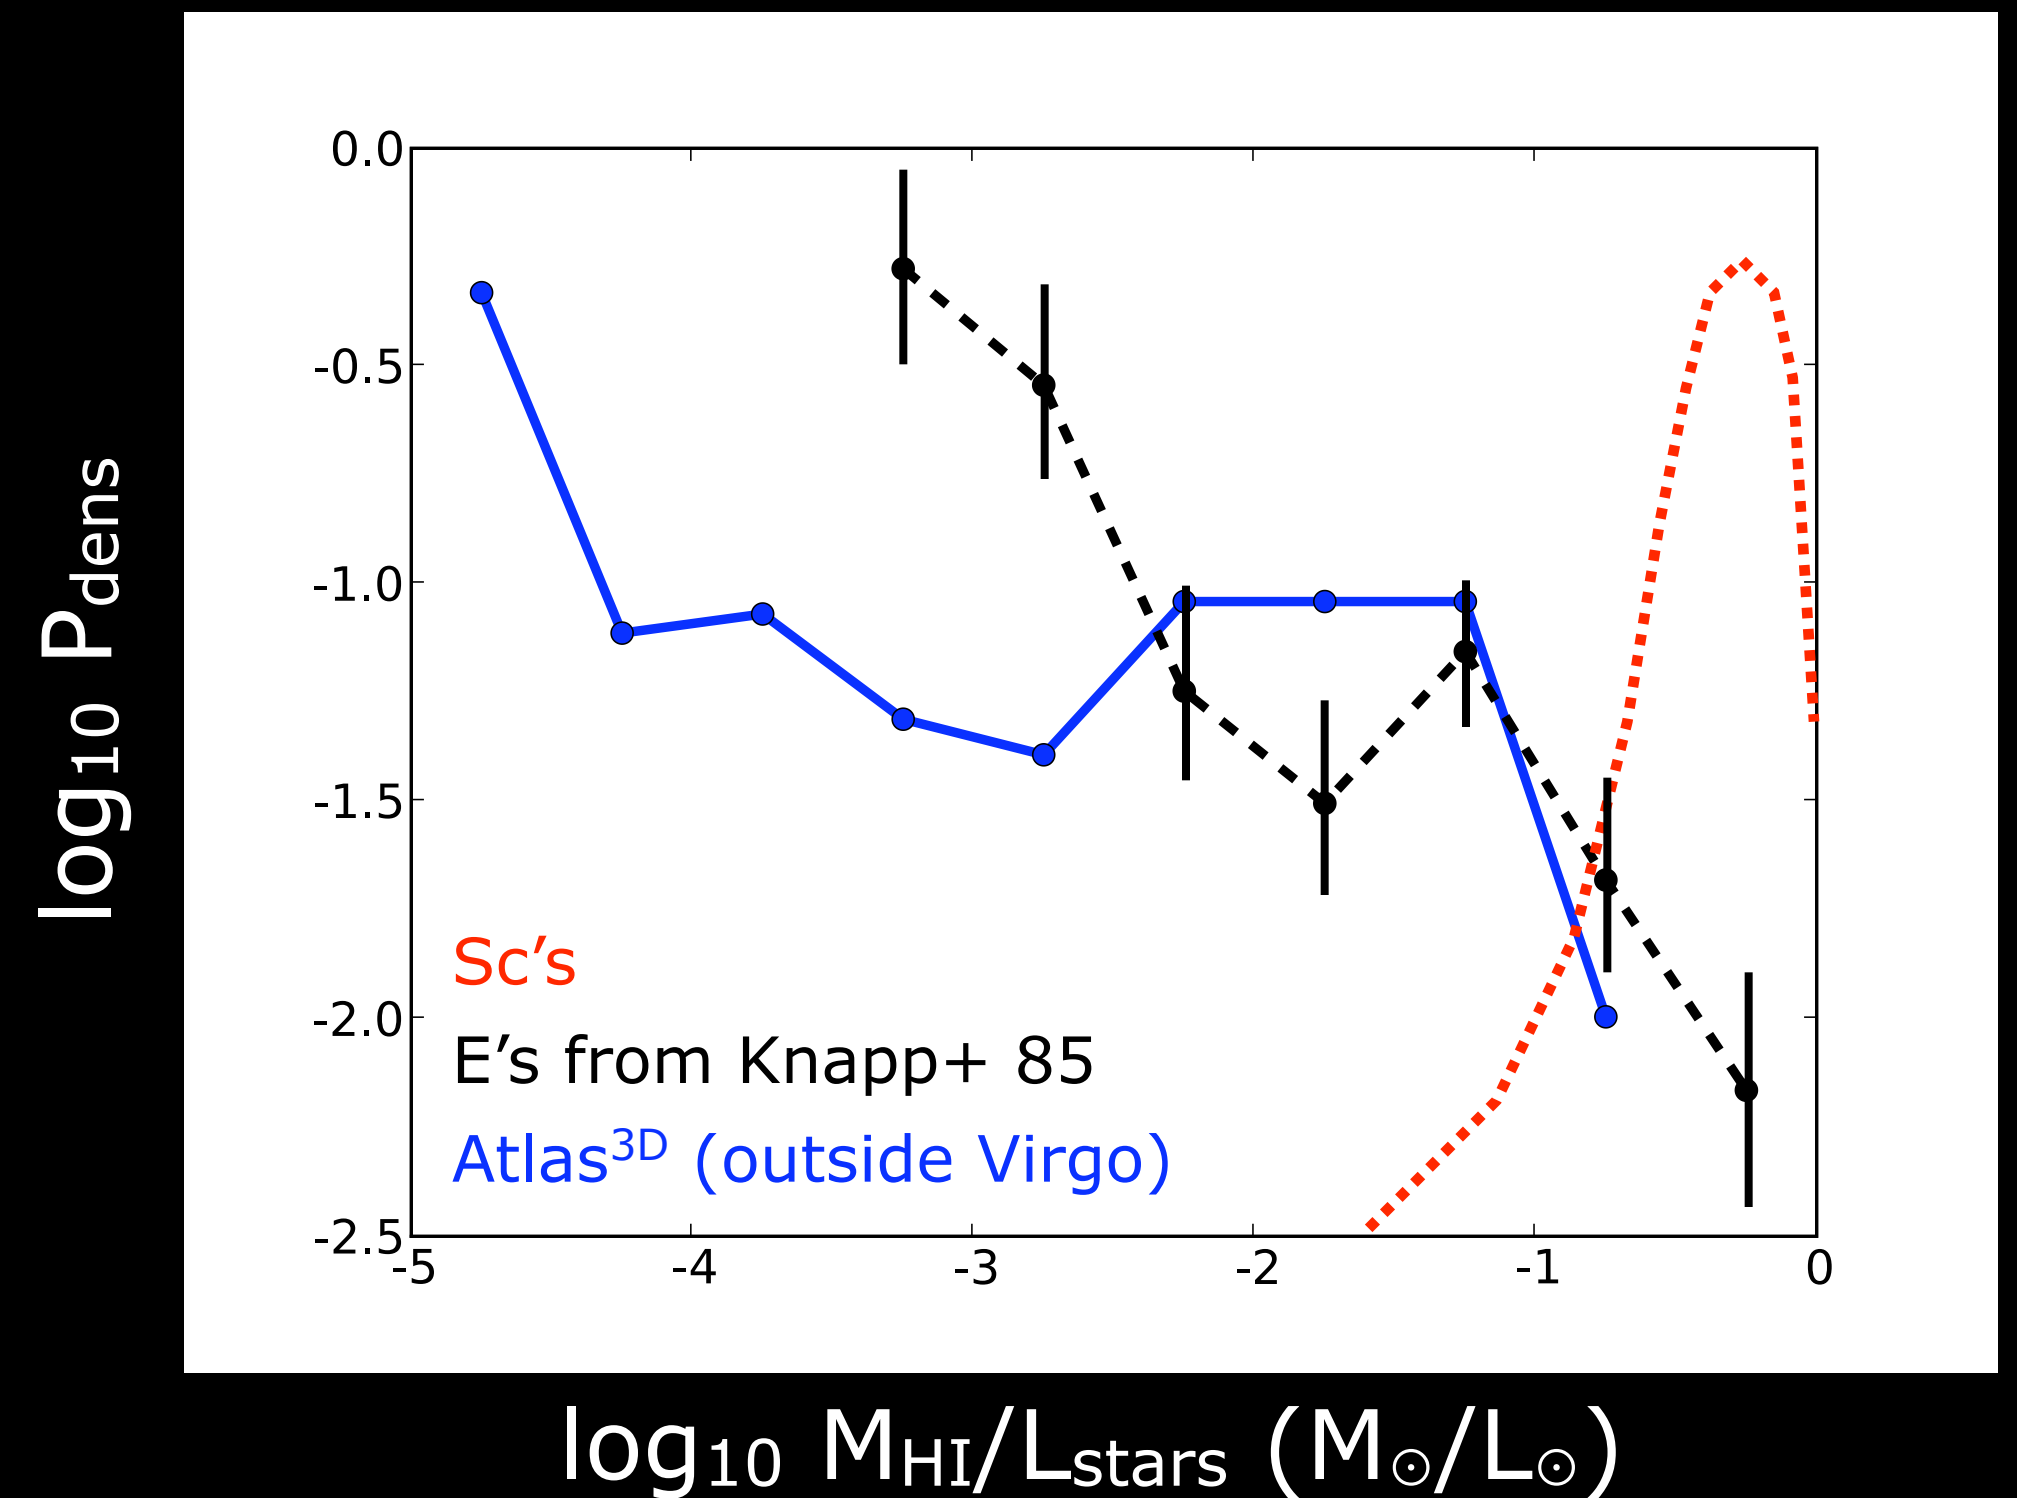

Detection rate: ~40% outside Virgo

dec > 10 deg:

all non-Virgo galaxies => 127 ETGs (full synthesis)

Virgo galaxies detected in Alfalfa (7/44)

Detection rate: ~40% outside Virgo

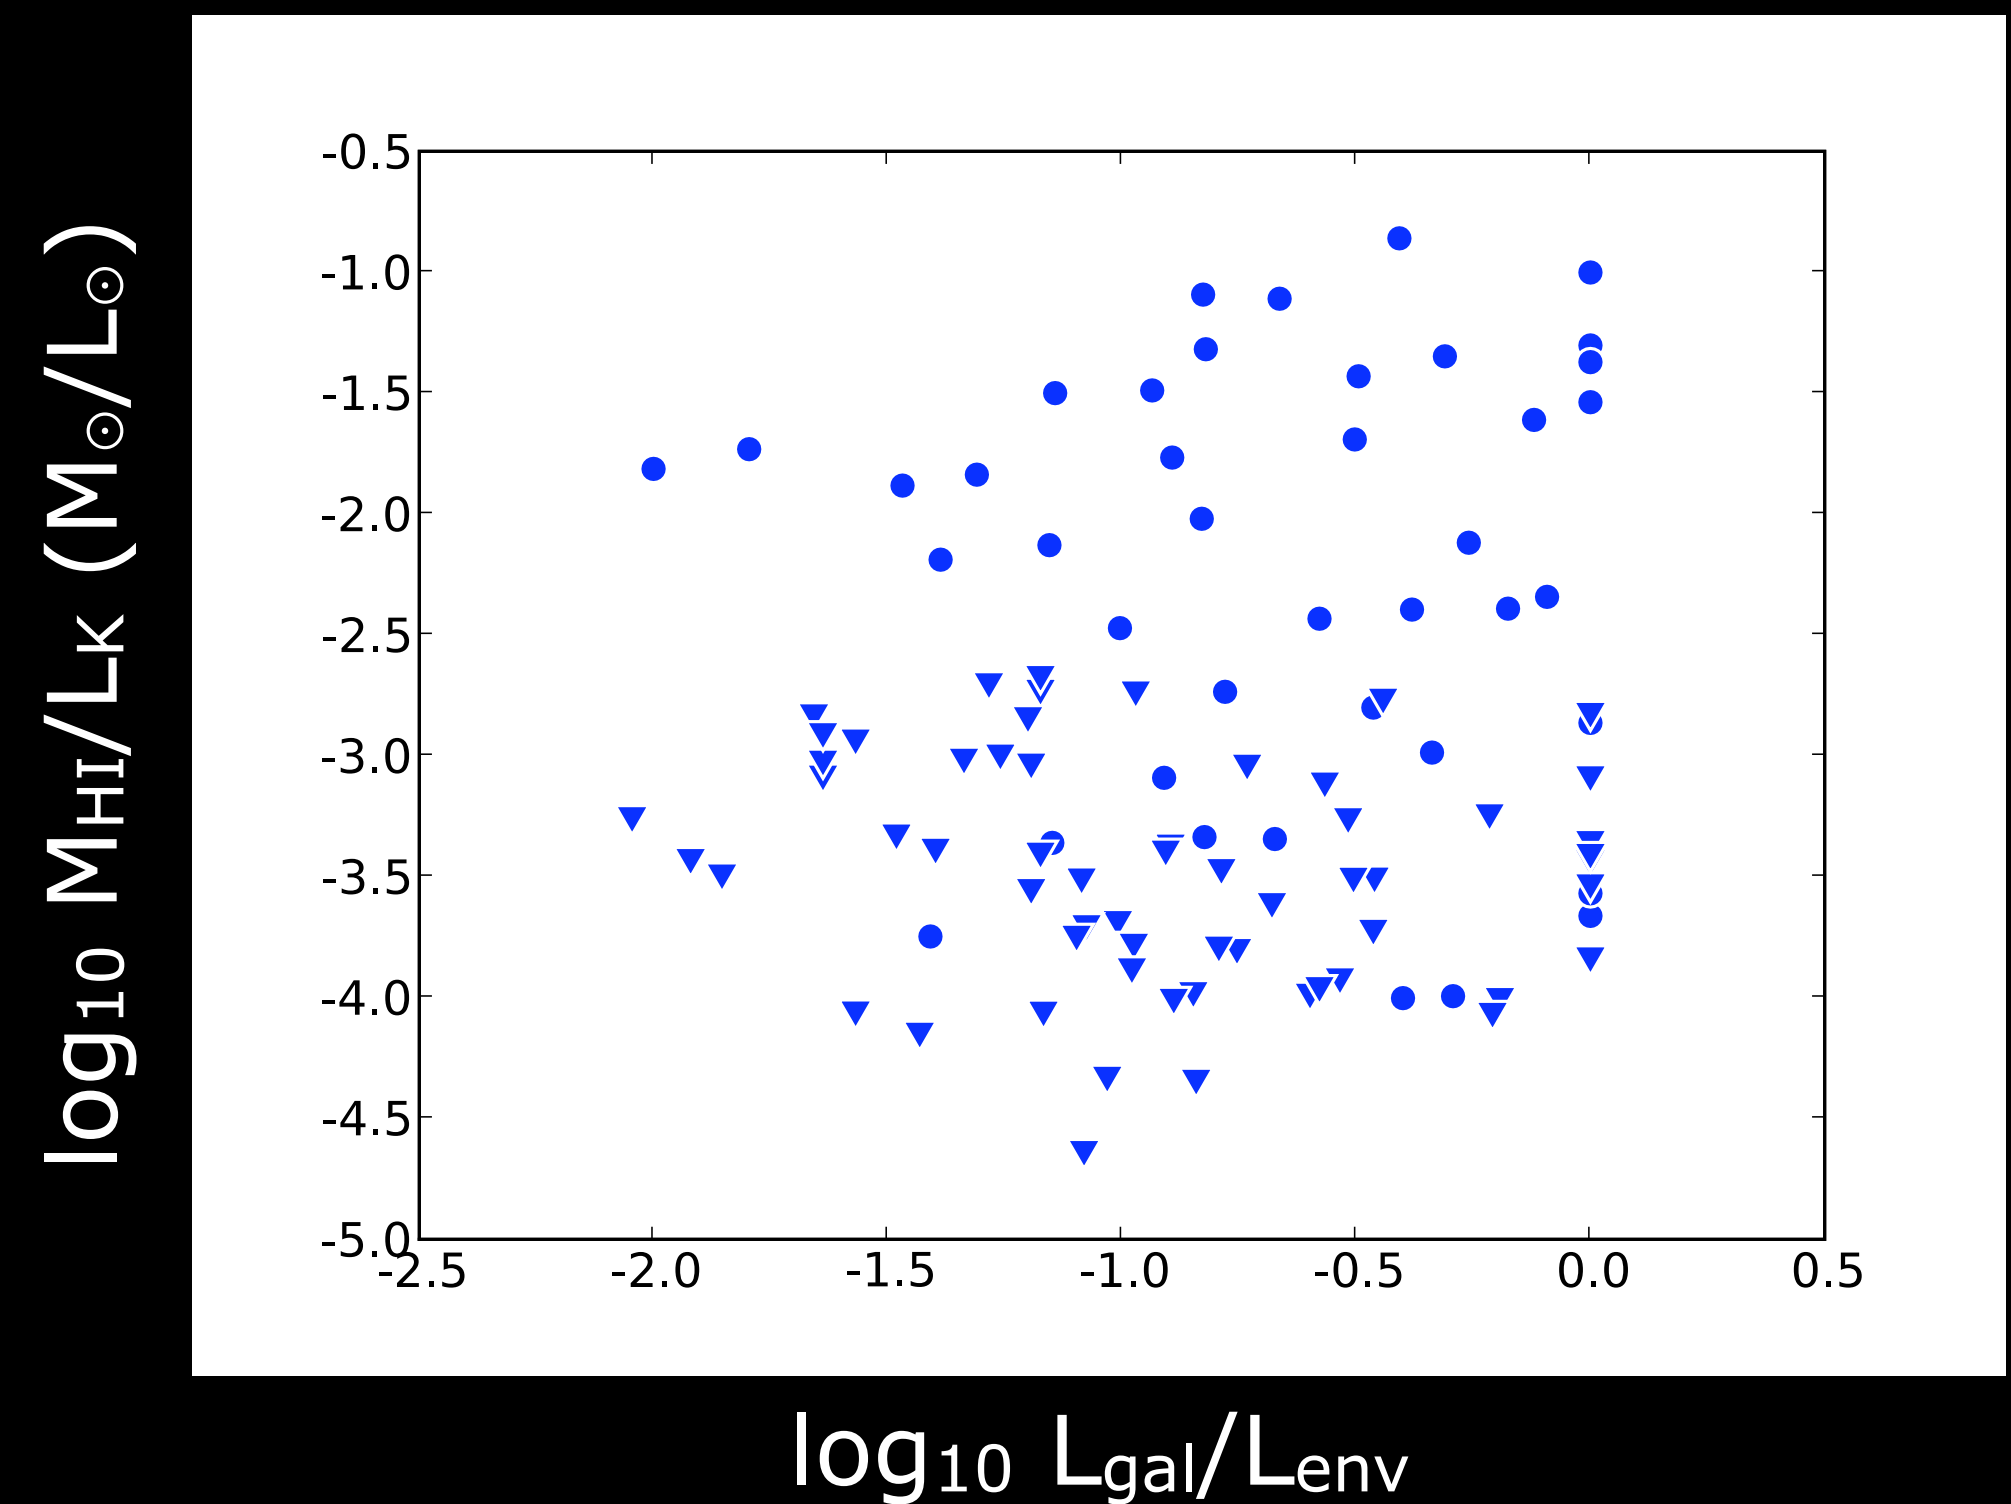

HI external origin?

Environment = all galaxies within 1 Mpc, ± 300 km/s, and with $M_K < -21.5$

Isolated galaxies: $L_{\text{gal}}/L_{\text{env}} \sim 1$

Environment = all galaxies within 1 Mpc, ± 300 km/s, and with $M_K < -21.5$

Isolated galaxies: $L_{gal}/L_{env} \sim 1$

HI in ETG's and environment: gas morphology

$L_{\text{galaxy}}/L_{\text{environment}}$

$n_{\text{HI}} > 1.5 \times 10^{19} \text{ cm}^{-2}$

180 kpc

HI in ETG's and environment: gas morphology

$L_{\text{galaxy}}/L_{\text{environment}}$

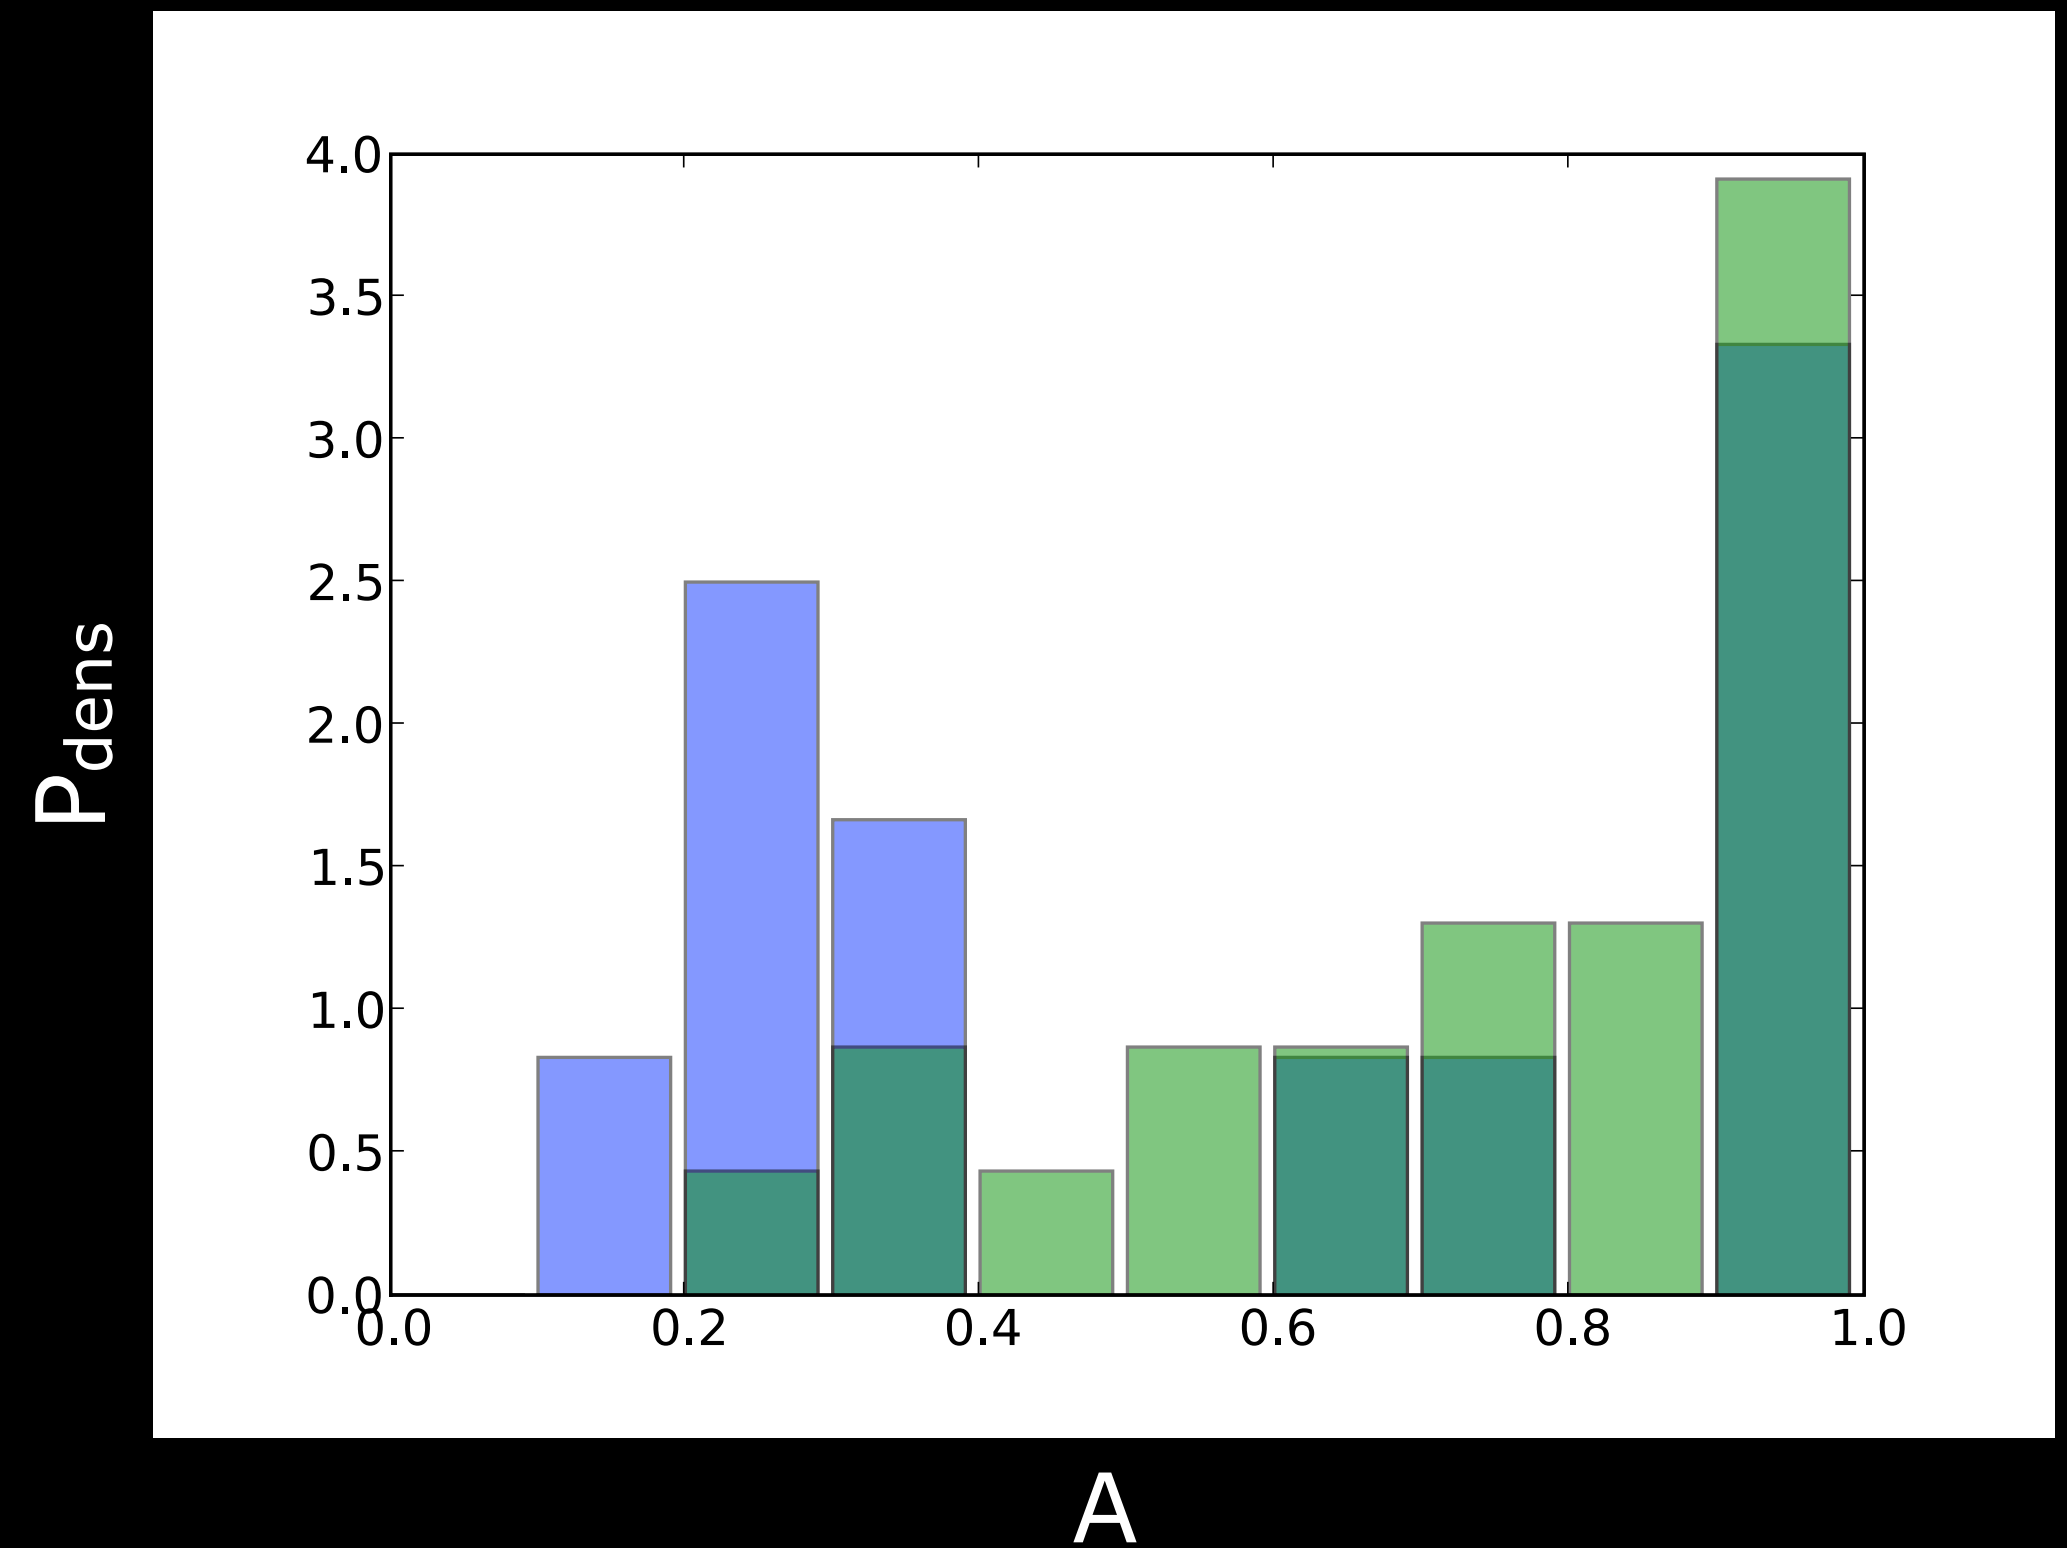

$n_{\text{HI}} > 1.5 \times 10^{19} \text{ cm}^{-2}$

180 kpc

$$A = 0.5 \times \sum |I_0 - I_{180}| / \sum I_0$$

■ isolated

■ non isolated

The on-going assembly of ETGs

The current front-end will be replaced by focal plane arrays on the WSRT dishes:

- FOV will increase by a factor ~ 25
- Instantaneous bandwidth 300 MHz, i.e., $z=0-0.3$ for HI

Ideal for \sim all-sky surveys out to $z\sim 0.3$

Atlas^{3D} "surveyed" volume : $7.5 \times 10^{-5} \text{ Gpc}^3$
Apertif survey (dec > 30°) @ $z \leq 0.1$: $1.2 \times 10^{-1} \text{ Gpc}^3$

Factor of $> 10^3$ in volume, but to what depth?

Atlas^{3D} “surveyed” volume : $7.5 \times 10^{-5} \text{ Gpc}^3$

Apertif survey (dec > 30°) @ $z \leq 0.1$: $1.2 \times 10^{-1} \text{ Gpc}^3$

Factor of $> 10^3$ in volume, but to what depth?

E.g., how will we see NGC 6798 ?

$$M_{\text{HI}} = 2.3 \times 10^9 M_{\odot}$$

For the full movie, please contact pserra AT astron.nl

$z=0.02$

$z=0.05$

$z=0.08$

600 kpc

$t = 10 \times 12 \text{ h}$

beam = $27'' \times 23''$

$\sigma_{\text{Apertif}} = 1.4 \times \sigma_{\text{MFFE}} \sim 100 \mu\text{Jy/beam} @ dv=16 \text{ km/s Hanning-smoothed}$

Atlas^{3D} survey first results:

- 40% of early-type galaxies outside Virgo contain HI
- flat $M_{\text{HI}}/L_{\text{stars}}$ function between 10^{-4} and $10^{-1} M_{\odot}/L_{\odot}$

HI and environment of ETGs

- strong dependence of HI mass on environment (Virgo vs. non-Virgo)
- dependence of HI morphology on environment (groups vs. more isolated galaxies)
- high fraction of interacting objects when looking at 21 cm

Apertif and ETGs

- $>10^3$ x Atlas^{3D} shallow-survey volume @ $z \leq 0.1$
- 10 x 12 h integration needed to study ETG properties at $z \sim 0.05$
